Subject: Encina Biosolids, Energy and Emissions Plan

Dear Scott,

Brown and Caldwell is pleased to deliver the Biosolids, Energy and Emissions (BEE) Plan Executive Summary and Technical Memoranda through 8.

The contents have been carefully reviewed and coordinated with Encina Wastewater Authority staff to ensure that the content is current, technically correct and contextually complete to address the processes' decisions for the coming decades of service.

We are thrilled to have travelled along with such capable and thoughtful people and look forward to many miles ahead. Should there be any questions or concerns regarding this content, or any other pertinent matters, please do contact Brown and Caldwell.

Very truly yours,

**Brown and Caldwell** 

Scott Lacy Project Manager

# **Biosolids Energy and Emissions Plan**

# **Executive Summary**

The Encina Wastewater Authority (EWA) has undertaken a Biosolids Energy and Emissions (BEE) Plan that will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- Provide a comprehensive analysis of all project elements including biosolids treatment, biogas use, energy generation, and waste heat
- Address capacity limitations in the solids handling process at the Encina Water Pollution Control Facility (EWPCF)
- Assess which alternative is likely to be the most cost-effective and sustainable solution for EWA
- Move EWPCF toward lower energy costs, rate stability, and greater overall sustainability
- Reduce greenhouse gas emissions

As part of the BEE Plan, the Brown and Caldwell (BC) team performed an extensive technology and alternatives analysis which is documented in a series of eight technical memoranda. Major decisions were made, including technology selection and narrowing of alternatives, in a series of workshops with EWA staff. Table ES-1 includes a list of these eight technical memoranda.

	Table ES-1. Summary of BEE Technical Memoranda
TM 1	Baseline Energy Profiles and Projections
TM 2	Technology Evaluations for Biosolids Handling
TM 3	Technology Evaluations for Alternative Power Production
TM 4	Technology Evaluations for Biogas Production
TM 5	Technology Evaluations for Waste Heat
TM 6	Air Emissions
TM 7	Alternatives Development, Evaluation, and Selection
TM 8	Grant Incentive Programs Summary

#### **BEE Process**

The process began with an evaluation and selection of technologies for solids processing and energy generation. The technologies selected are presented in Table ES-2. These technologies were subjected to a fatal flaw screening process and evaluated for the following fatal flaw criteria:

- There must be at least one full-scale installation of the technology at a wastewater treatment plant (WWTP) in North America
- There must be at least one successful installation of the technology at a facility of similar size to EWPCF to ensure compatibility
- The technology must be accommodated within EWPCF's limited available footprint

• The technology must be capable of being integrated into the existing treatment infra-structure If a given technology failed any of the fatal flaw criteria, it did not proceed to the next round of evaluation.

	Table ES-2. Evaluation and Selection of Technologies for Solids Processing and Energy and Heath Utilization							
	Solids Processi	ng Technologies	Enc	ergy and Heat Utili	zation			
Thickening	Stabilization	Dewatering	Post Digestion	Biogas Treatment	Energy Generation	Waste Heat Utilization		
Primary clarifier	Mesophilic anaerobic digestion	Centrifuge	Direct drum drying	Biogas upgrading	Internal combustion engines	Small-scale steam turbines		
Dissolved air floatation	Mesophilic high- solids digestion	Belt filter press	Indirect drying	Gas conditioning	Microturbines	Thermophilic digestion or thermal hydrolysis process		
Rotary drum	Staged mesophilic anaerobic digestion	Screw press	Solar drying	Exhaust treatment	Direct use of biogas in drying	Adsorption and absorption chillers		
	Acid-gas phase digestion	Rotary press	Gasification	WAS pretreatment	Fuel cells	Organic Rankine cycle		
	Thermophilic anaerobic digestion	Volute press	Pyrolysis	Increased co- digestion	Energy storage (batteries)	Gasification of biosolids		
	Temperature- phased anaerobic digestion	Bucher press	Incineration		Large-scale photovoltaics			
	Thermal hydrolysis process		Deep-well injection		Small-scale photovoltaics			
	Enzymatic hydrolysis		Dehydration		Wind turbines			
	Thermo-chemical hydrolysis				Direct sale to adjacent power plant			
	Lystek				Net energy metering			

Technologies in <u>blue</u> were considered in the end-to-end alternatives.

Following the fatal flaw evaluation, technologies were scored and ranked for a series of criteria developed with EWA. While some criteria overlap, unique criteria were developed for the solids and energy related technologies. Technologies were ranked on a scale of 1 to 5, with scoring performed in a workshop setting. Those with an aggregate score of under 3 were eliminated from further analysis. Those technologies that were used in the formation of end-to-end alternatives are presented in bold in Table ES-3; alternatives that are not presented in bold were eliminated from further consideration.

	Table ES-3. BC R	eport Grid Style	
Criterion	Description	Scoring Description	Weight
Proven Technology Performance	Proven and reliable technology with same configuration intended at Encina.  Long successful operating track record.	Low score indicates no successful large-scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.  High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration > 5 years, and vendors in western USA.	20%
Minimize Life-Cycle Costs	Qualitative metric of program cost.  Capital and 0&M costs based on existing EWA data or similar experience at other WWTPs.  Potential revenues from sales.	Low score indicates high capital cost to build onsite facilities, high 0&M costs, and low energy recovery efficiency.  High score indicates low capital cost to build onsite facilities, low 0&M costs, and potential revenue.	10%
Energy/Resource Recovery	Recovery of renewable energy.	Low score indicates high energy requirement for onsite technology, technology does not recover, and low efficiency recovery of renewable energy.  High score indicates a higher electrical efficiency.	25%
O&M Impacts	Impacts to existing plant O&M staff levels.  Complexity of new technology O&M and control systems.  Reliability of new technology (potential	Low score indicates more O&M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and newer hazards.  High score indicates reduction in O&M staff time	10%
	downtime).  Minimal impacts to plant safety.	required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new hazards.	
Environmental Impacts	Impacts to carbon footprint and air permitting.	Low score indicates high carbon footprint for technology, and new permitting for environmental regulatory requirements.  High score indicates low carbon footprint for technology, reduced pollutant emissions, no additional permitting for environmental regulatory requirements.	15%
Community & Stakeholder Impacts	Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.  Assess impacts to partner agency issues/values as well as local	Low score indicates nuisance factors for on-site technology are difficult to mitigate.  High score indicates nuisance factors can be mitigated at plant site.	10%
Project Site Compatibility	Assess compatibility of technology with available plant footprint. Incorporation into existing treatment process.	Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant.  High score indicates available footprint for new facilities and maintains space for future facilities, ease of integration with existing processes and facilities.	10%

The BC team then worked with EWA to create over 48 end-to-end alternatives, which evaluated the solids process from thickening to final disposition, as well as assessing biogas treatment and beneficial use. Figure ES-1 shows how the technologies that passed the evaluation scoring criteria were combined to create end-to-end alternatives.

Figure ES-1. Technologies that passed evaluation scoring criteria combined to create end-to-end alternatives

Alternatives were developed for beneficial use of digester gas alongside solids handling improvements. The digester gas utilization alternatives included engine-based cogeneration systems, microturbine-based cogeneration systems, and gas separation to produce renewable natural gas (RNG) for pipeline injection. All technologies were evaluated across a range of DG production rates and various solids stabilization methods, which assumed various levels of co-digestion of organic high-strength waste (HSW). Alternatives were compared to a status quo alternative that assumed DG would be used to operate the existing cogeneration engines and solids dryer, with the remainder of gas flared when the dryer is down for maintenance. Solids handling alternatives included options to upgrade or enhance digestion capacity and final biosolids quality, including thermophilic digestion (Class B and Class A), thermal hydrolysis process (THP), and Omnivore, as well as mesophilic digestion, EWA's existing stabilization technologies. Nearly all solids processing alternatives were evaluated with both one or two dryer trains in service.

The top 5 end-to-end options evaluated are summarized in Figure ES-2. These alternatives were evaluated over two rounds of modeling and are represented on a net present value (NPV) basis.

Figure ES-2. Overall NPV for top 5 alternatives

The top 5 end-to-end alternatives all have similar capital and NPV costs; therefore, cannot be screened based on economics alone. In addition, these alternatives have similar near-term project components such as digester improvements and RDTs for co-thickening. For all alternatives, long term projects should be selected based on meeting capacity, resiliency against changes, reducing odor, and reducing truck traffic at the plant.

## **Key Findings**

Alternatives were ranked based on the 20-year NPV model results. The key findings of the analysis are listed below:

- All alternatives benefited from increased DG production from co-digestion of organic HSW.
- Improved thickening with rotary drum thickeners (RDT) provides multiple benefits and has reduced lifecycle costs compared to the existing thickening scheme.
- Thermophilic digestion allows for a higher loading potential of HSW for co-digestion; however, all solids alternatives are compatible with the existing engines or pipeline injection alternatives for DG utilization. There is currently no direct driver to upgrade to thermophilic.
- While the second dryer train does not perform as well on an NPV basis in nearly all alternatives, there are non-cost and practical reasons to implement a second train. The timing of bringing this second train on line to realize the most cost savings will be a very important decision for EWA.
- Upgraded DG for use as vehicle fuel, via pipeline injection, provides the greatest apparent NPV compared to cogeneration systems or in the solids dryer.
- Continued use and operation of the cogeneration system is recommended. Any measures that
  increase permitted cogeneration energy production or reduce the cost of electricity should be
  pursued. A net electric metering (NEM) tariff would reduce electric utility costs by eliminating the
  standby charge—it would also allow for power export and simplify (or eliminate) the EWPCF's

current grid isolation practice. Any air permit revisions to allow for greater DG utilization and energy output are recommended. The addition of upstream DG conditioning and exhaust treatment using a carbon monoxide (CO) catalyst appears to be the best pathway. Any changes that trigger more stringent exhaust treatment measures, such as selective catalytic reduction (SCR) or continuous emissions monitoring systems, should be avoided.

### **Implementation**

Among the top performing alternatives, a series of near term (defined as 0 to 5 years) projects were common. These included digester improvements to address capacity issues, co-thickening improvements (RDTs), high strength waste receiving upgrades, and pipeline injection of biomethane. The BC team recommends that EWA address these near-term projects in its capital planning efforts. The majority of the mid-term (5-10 years from now) also had common elements, including dryer modifications, Class B biosolids truck loadout improvements, an Omnivore project, and centrifuge upgrades. The main differences between these options are that the mid-term projects address a mixture of aging equipment as well as desirable improvements to support high strength waste receiving and biosolids beneficial reuse while the near-term projects address immediate constraints and opportunities associated with the solids and energy processes at the EWPCF. Ultimately, the long-term (10 to 20 years) decisions are what distinguish the top performing alternatives and allow for full implementation of the recommended alternative, which includes a second dryer, an additional Omnivore project, and truck traffic improvements. These long-term projects will address the future increase in solids loadings to the EWPCF.

BC worked with EWA to develop a preferred alternative and discussed issues with associated phasing. Ultimately, addressing digester capacity early on in the program allows EWA to expand its co-digestion program and boost digester gas production. Timing on construction of the second dryer can be evaluated in further detail depending on the expansion of the co-digestion program and performance of thickening and digestion improvements with respect to solids reduction. Figure ES-3 shows an implementation schedule for the recommended alternative based on cost, resiliency, ability to meet plant capacity, and reducing truck traffic and odors.

TM Technical Memorandum

# **Executive Summary**

This Technical Memorandum (TM) 1 is the first of seven TMs comprising the Encina Wastewater Authority (EWA) Biosolids Energy and Emissions Plan. TM 1 serves to establish the baseline for planning by providing a summary of the current mass and energy balance for the Encina Water Pollution Control Facility (EWPCF), as well as a projection of future flows and loads. This data will be used in sizing and process related calculations in future tasks.

Tables ES-1 and ES-2 summarize EWPCF's major solids stream processes and their rated capacities for non-digestion and digestion processes, respectively. A mass balance was performed around the solids handling stream incorporating these processes; Figure ES-1 summarizes the results of this calibrated mass balance. All values in the figure describe averages over the 2-year period from May 2015 to June 2017 with loadings rounded to the nearest 100 pounds per day. All assumptions are documented in Section 2.2. This mass balance was reviewed by EWA staff in a workshop setting and subsequently finalized to incorporate additional EWA comments, data, and information. It must be noted that the mass balance was calibrated to agree with assumptions on process parameters and data that were deemed most representative. This was performed after a thorough review of the historic data and in consultation with EWA staff. For some parameters, EWA may wish to change the details of sampling to gain a better understanding and accuracy of those mass balance parameters.

Table ES-1. Major Non-Digestion Solids Stream Processes and Corresponding Capacities at EWPCF								
		No. of Units		Capacity		Percent of Capacity Used		
Process	Technology	Total	Normal Service	Design Loading Rate <sup>5</sup>	Total Service Capacity	Average Annual Condition	Peak Month Condition <sup>6</sup>	Peak Day Condition <sup>6</sup>
Thickening	DAF	3	2	0.72 lb/hr/sf	90,000 lb/d1	33%2	40%	53%
Dewatering	Centrifuges	3	2	3,000 lb/hr	144,000 lb/d	<b>26</b> % <sup>3</sup>	32%	42%
Solids Drying	Thermal Dryer	1	1	30 dtpd	30 dtpd	60%4	74%	96%

<sup>&</sup>lt;sup>1</sup> Calculated assuming two 40-ft diameter DAF units in normal service.

DAF = dissolved air flotation; dtpd = dry tons per day; lb/d = pound(s) per day; lb/hr = pound(s) per hour.

<sup>&</sup>lt;sup>2</sup> Calculated using average dry solids loading from calibrated mass balance (29,400 lb/d) to two 40-ft diameter service DAF units.

<sup>3</sup> Calculated using average dry solids loading from calibrated mass balance (38,700 lb/d) to service centrifuges.

<sup>&</sup>lt;sup>4</sup> Calculated using average dry solids loading from calibrated mass balance (17.8 dtpd) to dryer.

<sup>&</sup>lt;sup>5</sup> Thickening and dewatering capacities provided in the 2016 Process Master Plan. Dryer capacity provided by vendor.

<sup>&</sup>lt;sup>6</sup> Peaking conditions were applied using the peaking factors developed in section 4.6.

	Table ES-2. Digester Capacity at EWPCF									
Process	Technology	No. of Units			Design Loading	Measured	Percent of			
		Total	Normal Service	Condition	Rate <sup>1</sup>	Value	Capacity Used			
Digestion	Mesophilic Digesters			Average Volatile Solids Loading; All units in service	0.15 lb/cf/d	0.08 lb/cf/d	40%			
				Average Volatile Solids Loading; Two units in service	0.18 lb/cf/d	0.12 lb/cf/d	67%			
		3	3	3	3	2	Peak 2-week2 Volatile Solids Loading; All units in service	0.18 lb/cf/d	0.16 lb/cf/d	86%
				Hydraulic Loading; Two units in service	15 days minimum	19.6 days	77%			
				Hydraulic Loading; All units in service	15 days minimum	29.3 days	51%			

 $<sup>^{</sup>m 1}$  Digester capacities based on Brown and Caldwell standard design criteria for mesophilic digestion.

<sup>&</sup>lt;sup>2</sup> Peaking condition was applied using the peaking factors developed in section 4.6. lb/cf/d = pound(s) per cubic feet per day.

Figure ES-1. Process flow diagram describing the mass balance around the solids stream at EWPCF

Electrical and natural gas purchase and production data were analyzed to establish baseline energy values, summarized in Table ES-3. Self-generated electrical power was about 83 percent of the total electrical usage during the baseline period. Annual average production, import, and total usage in terms of kilowatts (kW) was calculated based on 8,760 hours per year.

Table ES-3. EWA Power Production and Demand Summary								
Annual Production, MWh Annual Import, MWh Annual Usage, MWh								
June 2015 to May 2016	13,306	3,956	17,262					
June 2016 to May 2017	13,200	2,796	15,996					
	Annual Average Production, kW	Annual Average Import, kW	Annual Average Usage, kW					
June 2015 to May 2016	1,519	452	1,971					
June 2016 to May 2017	1,507	319	1,826					

<sup>&</sup>lt;sup>1</sup> Excluding September 2015 from calculation. Power import during this month was an order of magnitude higher than average values.

kWh = kilowatt hour; MWh = megawatt hour.

With respect to electrical costs, the majority of San Diego Gas and Electric (SDG&E) bills are charges for non-coincident (NC) demand and standby demand. On average, from February 2015 to March 2017, NC demand plus standby demand constituted 68 percent of the total SDG&E electricity bill. Average cost for electricity calculated in dollars per kWh (\$/kWh), when all charges were included (total usage [kWh]/total electric charge), ranged from \$0.19 to \$0.40 \$/kWh. If NC and standby demand charges are excluded, the calculated value drops to \$0.09 to \$0.11 \$/kWh.

Figure ES-2. Average percent of electrical usage for each process building or function

CEPT = Chemically Enhanced Primary Treatment

When measuring biogas production, EWA takes flow measurements from each individual operating digester gas lateral (4, 5, and 6). Historical data from the 'Gas Data Monthly' information provided by Operations were used to determine the baseline biogas production. During this period, the digesters produced an average of 522 standard cubic feet (scf) per minute (scfm). Biogas production in terms of energy, volume, and flowrate that will be carried forward as the project baseline is summarized in Table ES-4. Biogas is used to either fuel the internal combustion engines, supplement gas demands in the solids dryer, or is wasted through the flare.

Table ES-4. Biogas Production Summary						
	Annual Production, therms	Annual Production, MMscf	Average Flowrate, scfm			
Baseline	1,580,000	263.3	501			

 $<sup>^{1}</sup>$  Assuming 600 British thermal units per cubic foot higher heating value for biogas. MMscf = million standard cubic feet.

Natural gas is used at the plant for a variety of uses in the following processes:

- Electrical power production in internal combustion engines (directly and through Eclipse air dilution unit)
- Sludge dryer
- Regenerative thermal oxidizer
- Space and water heating in the Administration and Maintenance Buildings
- Flare pilot light

Natural gas purchases are recorded by an EWPCF master meter and reported in volume (scf) and energy (therms) in monthly invoices. EWA also maintains several internal natural gas meters which were used to develop the baseline natural gas use throughout the plant. The total natural gas purchased by the EWPCF during the period between May 2015 through March 2017 was 1,633,000 therms. In-plant monitoring during that same period reported a usage of 1,610,000 therms—about 1 percent lower. The difference in recorded values is within acceptable tolerances for analysis and shows good agreement on flow meter accuracy. The unit cost for natural gas during the same period fluctuated month by month, ranging from \$0.24 to \$0.39 per therm, with an average of \$0.31 per therm. Natural gas is purchased through a consortium which reduces cost compared to direct purchase from SDG&E.

Heat is produced at the plant via the engines and is utilized by the anaerobic digesters and an absorption chiller. The plant intends on transitioning from the absorption chiller to a conventional heating, ventilation, and air conditioning system; therefore, this demand will not be accounted for in future baseline heat demand. Available heat that can be recovered from the engines is estimated to be 40 percent of the fuel input based on previous studies for similar situations since historical data was not provided. With two 750 kW engines running at full output, approximately 6.0 million British thermal units (MMBtu) per hour (MMBtu/hr) can be recovered to the plant's hot water loop. The remainder of engine heat that is not needed is wasted to the plant's effluent. Dryer/regenerative thermal oxidizer (RTO) waste heat is discharged as hot air. The baseline heat production and usage are summarized in Table ES-5.

Table ES-5. Heat Production and Usage							
	Production, MMBtu/hr Usage, MMBtu/						
Engines	6.0	-					
Dryer/RTO	1.4	-					
Digesters	-	1.2					
Total	7.4	1.2					

### **Section 1: Introduction**

The Encina Wastewater Authority (EWA) has undertaken a Biosolids Energy and Emissions Plan (BEE Plan), which will serve to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- Provide a comprehensive analysis of all project elements, including biosolids treatment, gas use, energy generation, and waste heat.
- Address capacity limitations in the solids handling process at the Encina Water Pollution Control Facility (EWPCF)
- Develop the most cost effective and sustainable solution for EWA
- Move the EWPCF towards greater energy independence
- · Reduce greenhouse gas emissions

The outcome of this process is an implementable plan resulting in capital improvements to expand solids processing capabilities, maximize resource recovery capabilities for EWA, and optimize energy production. The BEE has been broken out into discrete tasks as follows:

- 1. Technical Memorandum (TM) 1: Baseline Energy Profiles and Projections
- 2. Technology Evaluation for Biosolids Handling
- 3. Technology Evaluation for Alternative Power Production
- 4. Technology Evaluation for Biogas Production
- 5. Technology Evaluation for Waste Heat
- 6. Air Emissions Evaluation
- 7. Alternative Scenarios Development, Evaluation, and Selection
- 8. Grants and Incentives

Tasks 2 through 5 involve technology evaluation in parallel to allow for the creation of holistic, end-to-end alternatives that include solids treatment, codigestion, gas use, waste heat use, and final biosolids disposition. These end-to-end alternatives are evaluated under Task 7. Task 6 will assess any regulatory limitations associated with emissions from selected processes. Task 8 is ongoing throughout the BEE Plan process and allows for the identification of grants and incentives, including their impact on the financial model used in Task 7.

The purpose of Task 1, summarized in this TM 1, is to establish the baseline for planning purposes. All subsequent sizing and process calculations will be based upon the data presented in this TM. The initial set of calculations described in Sections 2 through 4 was presented in a workshop with EWA staff on August 16, 2017, during which time EWA staff provided feedback and additional information.

# **Section 2: Existing Solids Mass Balance**

A mass balance was performed on the solids handling process, tracking total and volatile solids (VS) through the treatment process at the EWPCF to determine baseline process operating conditions. Calculations were primarily based on 2-year average flows and loads using process data provided by EWA Operations staff ranging from May 2015 to June 2017. This section describes the calculations used in this evaluation and the results of the mass balance. Additionally, a summary of the solids stream process is provided below and several assumptions that were made during this evaluation are documented.

## 2.1 Summary of Solids Process Stream

The solids process stream at the EWPCF uses a combination of solids thickening, mesophilic digestion, and centrifuge dewatering to produce a Class B cake product. Additionally, a heat dryer is used to produce dried pellets. The process flow diagram in Figure 2-1 shows the major components.

Figure 2-1. Solids process stream at EWPCF

Waste activated sludge (WAS) is thickened using dissolved air flotation (DAF) thickeners. The thickened WAS (TWAS) stream forms part of the digester feed. Primary sludge (PS) is fed directly to the digesters, as are inputs of high strength waste (primarily fats, oil and grease [FOG]), which are trucked in 5 to 6 days a week. Digested sludge is dewatered using centrifuges, and the cake produced is typically dried in a drum dryer. The typical service condition involves the use of one out of three DAF units, two out of three large digesters, two out of three centrifuges, and use of the single drum drying unit to generate granules. Class B dewatered cake is hauled directly to beneficial use sites when the dryer is not in service (i.e., due to extended maintenance outages).

A summary of the rated capacities of each of the solids stream processes is provided in Table 2-1 for non-digestion processes and in Table 2-2 for digestion process. The percent of total capacity that is used with current loading under average and peak conditions is also summarized. Note that these loads are based on the calibrated mass balance described in the next section. It is worth noting that the post-digestion processes may not see peak day solids loads since the digested sludge storage tank provides some buffering capacity. The digested sludge storage tank could provide 0.9 day of retention time at peak day condition.

Table 2-1. Major Non-Digestion Solids Stream Processes and Corresponding Capacities at EWPCF								
		No. of Units		Capacity		Percent of Capacity Used		
Process	Technology	Total	Normal Service	Design Loading Rate <sup>5</sup>	Total Service Capacity	Average Annual Condition	Peak Month Condition <sup>6</sup>	Peak Day Condition <sup>6</sup>
Thickening	DAF	3	2	0.72 lb/hr/sf	90,000 lb/d1	33%2	40%	53%
Dewatering	Centrifuges	3	2	3,000 lb/hr	144,000 lb/d	26%³	32%	42%
Solids Drying	Thermal Dryer	1	1	30 dtpd	30 dtpd	60%4	74%	96%

<sup>&</sup>lt;sup>1</sup> Calculated assuming two 40-ft diameter DAF units in normal service.

dtpd = dry tons per day; lb/d = pound(s) per day; lb/hr = pound(s) per hour; lb/hr/sf = pound(s) per hour per square feet.

Table 2-2. Digester Capacity at EWPCF								
Process	Technology	No. of Units  Total Normal Service		Condition	Design Loading Rate <sup>1</sup>	Measured Value	Percent of Capacity Used	
Digestion	Mesophilic Digesters	3		Average Volatile Solids Loading; All units in service	0.15 lb/cf/d	0.08 lb/cf/d	40%	
				Average Volatile Solids Loading; Two units in service	0.18 lb/cf/d	0.12 lb/cf/d	67%	
			2	Peak 2-week2 Volatile Solids Loading; All units in service	0.18 lb/cf/d	0.16 lb/cf/d	86%	
				Hydraulic Loading; Two units in service	15 days minimum	19.6 days	77%	
				Hydraulic Loading; All units in service	15 days minimum	29.3 days	51%	

<sup>&</sup>lt;sup>1</sup> Digester capacities based on Brown and Caldwell standard design criteria for mesophilic digestion.

lb/cf/d = pound(s) per cubic feet per day.

## 2.2 Assumptions

While the mass balance was based on plant data from the 2-year period spanning from May 2015 to June 2017, not all the data were directly applied to the calculations. The mass balance was calibrated using several alterations based on discussions with EWA staff and extensive review of the historic data. This resulted in some parameters that were changed from measured historic values. To summarize the process of developing and calibrating the mass balance, the reported daily masses of dewatered cake and pellets were used, along with an assumption on centrifuge capture rate in order to determine digested sludge loads. Assumptions on VS reduction (VSR) were then used to back-calculate digester loading. WAS and FOG data were deemed reliable by EWA Operations. Therefore, WAS load was used to forward calculate TWAS load, with a DAF capture rate assumption, and this was combined with total digester load to estimate primary sludge load.

<sup>&</sup>lt;sup>2</sup> Calculated using average dry solids loading from calibrated mass balance (29,400 lb/d) to two 40-ft diameter service DAF units.

<sup>&</sup>lt;sup>3</sup> Calculated using average dry solids loading from calibrated mass balance (38,700 lb/d) to service centrifuges.

<sup>&</sup>lt;sup>4</sup> Calculated using average dry solids loading from calibrated mass balance (17.8 DTPD) to dryer.

<sup>&</sup>lt;sup>5</sup> Thickening and dewatering capacities provided in the 2016 Process Master Plan. Dryer capacity provided by vendor.

<sup>&</sup>lt;sup>6</sup> Peaking conditions were applied using the peaking factors developed in section 4.6.

 $<sup>^{2}</sup>$  Peaking condition was applied using the peaking factors developed in section 4.6.

Details on the assumptions made in developing and calibrating this mass balance are documented below.

- TWAS data was forward-calculated using the WAS data and an assumed DAF removal of 95 percent. The
  VS fraction was assumed to be the same for WAS and TWAS based on an average of the percent VS
  determined in the lab.
- The EWPCF uses Chemically Enhanced Primary Treatment (CEPT) whereby ferric chloride and polymer are added to the wastewater prior to the primary clarifiers to improve clarifier solids removal, reduce the load on the secondary treatment process, and provide a ferric dose in the sludge that acts to limit sulfide content in the digesters and limit the hydrogen sulfide concentration within the digester gas. The dose of ferric chloride used at EWA is about 15 milligrams per liter (as FeCl3). The extra solids removed in the primaries, along with the chemical sludge, is all part of the total PS quantities discussed within this TM.
- Total solids (TS) measurements in the FOG stream were provided by EWA. Due to the high variability in the data (0.4 to 26 percent), the average FOG concentration of 5.5 percent was applied to the entire evaluation period. Additionally, the 2016 Process Master Plan (PMP) assumed that the volatile fraction of total solids was 80 percent; this assumption was used in the mass balance.
- FOG input data during the period from March 28 to April 28, 2017, were excluded because this period included the input of brewery waste, which is not representative of normal operation.
- Daily Class B cake and dried granule production masses were averaged inclusive of zero values. This is because Class B cake and dried pellets are not usually produced simultaneously, based on dryer operation.
- The centrifuge has an assumed capture rate of 95 percent. The assumption was used to back calculate the digested solids.
- VSR was determined using Van Kleeck and mass balance methods, yielding 57 percent and 63 percent, respectively. Based on discussions with operations at EWPCF, 60 percent VSR was used to back calculate the influent load into the digesters.
- Based on discussion with EWPCF staff, the TWAS and FOG feed were held constant and based on historical data. The PS feed was the reminder of the calculated digester feed. However, the PS, TS and VS were based on historical data.

#### 2.3 Results

Figure 2-2 summarizes the results of the mass balance. The mass balance values reported here and shown in Figure 2-2 are based on the average of daily values over the 2-year analysis period, with loadings rounded to the nearest 100 pounds per day (ppd). WAS is thickened in the DAF units from a TS concentration of approximately 0.5 to 5.5 percent. The VS fraction is 80 percent in the WAS stream. Primary sludge is pumped at an average total solids concentration of 4.1 percent, with a volatile fraction of 87 percent, fed directly to the digesters. FOG was assumed to be received at an average total solids concentration of about 5.5 percent with a volatile fraction of 80 percent. Primary sludge contributes to about 62 percent of total solids fed to the digesters; TWAS contributes about 33 percent, and FOG accounts for about 5.4 percent.

The digesters receive an average flow of about 0.21 million gallons per day (MGD) from the above three sources, resulting in a retention time of about 19.6 days with two digesters (2.05 million gallons each) in service. The TS load in the digester feed is about 79,400 ppd, and the VS load is about 67,800 ppd. This results in a digester loading rate of about 0.12 pounds of VS per cubic foot per day. Digested sludge is fed to the dewatering centrifuges at a total solids concentration of about 2.2 percent and a volatile fraction of about 70 percent. This results in centrifuge loading rates of about 38,700 ppd TS and 27,100 ppd VS. The centrifuges produce a Class B cake at a solids concentration of about 22 percent at about 84 wet tons per day or 18.4 dry tons per day. This cake is usually further processed into pellets using a heat dryer, and the pellet product is trucked off site. On rare occasions when the dryer is out of service for unscheduled maintenance, the dewatered Class B cake is hauled off site as is. Averaging these production values over the 2-year analysis period, the dryer was found to produce about 17.8 dtpd of pellets with a solids content of about 94 percent. Class B cake that is not dried is produced at an average rate of about 0.7 dtpd.

Table 2-3 summarizes the major parameters that describe operating conditions in the solids stream at the EWPCF. Figure 2-2 summarizes the mass balance values described above within a process flow diagram. All values in the figure describe averages over the 2-year period (May 2015 to June 2017) with loadings rounded to the nearest 100 ppd. As discussed earlier, it was determined after a thorough review of the historic data and discussions with EWPCF staff that measured values for certain parameters may not have been accurate and some sampling changes should be considered to try and improve accuracy in certain areas and verify the major operating parameters shown in Figure 2-2 are accurate.

Table 2-3. Summary of Average Operating Conditions (2015-2017)						
Parameter	Units	Calculated Value				
Digester Retention Time	days	19.61				
Digester VSR	percent	60 <sup>2</sup>				
Digester Volatile Solids Loading Rate	lb-VS/(ft³⋅d)	0.11				
Digester Gas Production	scf/lb-VS <sub>d</sub>	18				
Centrifuge Capture Rate	Percent	95				

<sup>&</sup>lt;sup>1</sup> Assuming two digesters in service.

 $lb\text{-VS/}(ft^3 d) = Pounds VS per cubic foot per day;$ 

 $scf/lb-VS_d$  = standard cubic feet per pound VS destroyed.

<sup>&</sup>lt;sup>2</sup> Assumed based on mass balance data, Van Kleeck calculations, and engineering experience.

Figure 2-2. Process flow diagram describing the mass balance around the solids stream at EWPCF

# **Section 3: Existing Energy Balance**

The baseline energy balance summarized in this section includes production and demand for biogas, electricity production, purchase and use, and natural gas demand and heat production. Historical data from June 2016 to May 2017 was used to calibrate the baseline values. Trends were plotted over a 2-year period, but Brown and Caldwell was notified that the plant replaced aeration basin diffusers mid-2016, and therefore, the data from June 2016 is more representative of the plant's baseline moving forward. This section describes the data used and the parameters modified to calibrate the model.

## 3.1 Electrical Energy Analysis

This section summarizes the electrical analysis conducted to support the calculated baseline values model including evaluations of electrical energy production, use, and cost.

#### 3.1.1 Electrical Energy Production and Use

EWA has four total 750 kilowatt (kW) Caterpillar engines, but typically operates two engines continuously at maximum output due to current air permit limitations on carbon monoxide emissions of 100 tons per year. During typical operation, two engines are fueled with unconditioned biogas. When biogas production is low, natural gas is air-diluted in an Eclipse unit and added to the engines' fuel stream to meet full engine output. Additionally, during utility peak power demand periods, the plant often runs a third 750 kW engine on natural gas and physically disconnects (island mode) from the grid to meet the plant's demand. Each engine is equipped with dual fuel capabilities.

Figure 3-1 shows the engine fuel consumption for both biogas and natural gas in units of therms, or energy. It was assumed that biogas has a higher heating value (HHV) of 600 British thermal units (Btu) per cubic foot (Btu/cf) and natural gas has a HHV of 1,000 Btu/cf. Over the baseline period, approximately 91 percent of the engine fuel input is sourced by biogas and the remaining 9 percent is sourced by natural gas. Note that November 2015 data is reported as an outlier due to an increase in natural gas consumption while a biogas flex coupling was being repaired.

Figure 3-1. Biogas and natural gas engine fuel consumption

Historical data over the baseline period was used to determine the power production and import. Plant staff indicated that the aeration diffusers were replaced with more efficient ones in mid-2016 (June), which is consistent with the decreased power usage. The baseline electricity usage will be determined based on data during the time following the installation of the new diffusers. Total annual power production and consumption is summarized in Table 3-1 and Figure 3-2. The annual power production is based on data from the California Energy Commission meters, which includes electricity generated by both the biogas and natural gas. The annual import is based on the 'Gas Data Monthly' information provided by the plant, and total usage is calculated as the sum of the production and import values.

Self-generated electrical power was about 83 percent of the total electrical usage during the baseline period. Annual average production, import, and total usage in terms of kW was calculated based on 8,760 hours per year.

Table 3-1. EWA Power Production and Demand Summary						
Annual Production, MWh Annual Import, MWh Annual Usage, MWh						
June 2015 to May 2016	13,306	3,956	17,262			
June 2016 to May 2017	13,200	2,796	15,996			
	Annual Average Production, kW	Annual Average Import, kW	Annual Average Usage, kW			
June 2015 to May 2016	1,519	452	1,971			
June 2016 to May 2017	1,507	319	1,826			

 $<sup>^{1}</sup>$  Excluding September 2015 from calculation. Power import during this month was an order of magnitude higher than average values.

MWh = megawatt hour.

Figure 3-2. Power production, import, and demand by month

Note: Self-generated power is approximately 83 percent of plant usage; September 2015 power import data removed from set as an outlier.

The following data were used to establish baseline power demand:

- Run hour data was used to approximate the percentage of total electrical usage for each unit process or location.
- Engine output electrical meter data and power import from San Diego Gas and Electric (SDG&E) bills were used to determine the total plant usage (not the "gas monthly" data).

The distribution of electricity use at the EWPCF was estimated based on run hour data provided by EWA. EWA monitors each system's run hours on a monthly basis. These run hours are used to calculate kW hours (kWhs) per month usage using an assumed power factor and average utilization (varied depend on equipment). Run hour data was provided from February 2015 through June 2017. Note that this projection likely overestimates total usage as compared to actual measured generation and SDG&E import and should only be used to qualitatively compare different parts of the plant's electrical usage. The average percent of electrical usage for each process during that period is provided in Figure 3-3. As shown in Figure 3-3, 40 percent of the monthly kWh usage is for the power buildings, which holds equipment such as fans, pumps for hot and chilled water, and blowers. Seventy-nine (79) percent of the power consumed at the plant is dependent on flow and administrative uses, with 21 percent of the total energy use related to solids loading.

Figure 3-3. Annual average percent of electrical usage for each process building or function

Total monthly energy demands and digester feed loads were used to decouple the energy involved in the solids treatment processes from the energy used for all other processes. Average daily energy demands (kWh per day [kWh/day]) and digester feed loads (lb/day) are plotted in Figure 3-4 for the months between June 2016 and May 2017. June 2016 was chosen as the starting month due to the installation of new aeration basin diffusers which significantly lowered average energy consumption. April 2017 was excluded due to the lack of digester feed loading values. A linear fit of this data provides a distinct relationship between solids loading and solids treatment energy consumption that is independent of the energy demand of liquid stream processes and administrative uses. Extrapolation of the linear fit points to an energy demand of 34,600 kWh/day that is independent of solids loading. The decoupling of energy demands allows for a more accurate prediction of increase in energy demand as it relates to future increases in solids loading. To correct for potentially inaccurate PS solids loading data, a reduction factor was applied to each month's primary sludge total solids loading. The correction factor was determined by the percent decrease in PS total solids from the annual average data to the extrapolated values used to predict future loads.

Figure 3-4. Daily energy demand dependence on daily digester loading and determination of baseline energy demand

#### 3.1.2 Baseline Electricity Cost Analysis

To conduct the baseline electricity cost analysis, EWA provided SDG&E electricity bills from February 2015 through March 2017. However, as described previously, the plant replaced aeration basin diffusers mid-2016; therefore, the data after that replacement is more representative of the plant's baseline energy cost. It should be noted that while SDG&E bills EWA monthly, the pay periods begin and end in the middle of the month. For the purposes of this TM, bills are noted by the end date of the billing period (i.e., "February 2015" represents a pay period from January 13 through February 11, 2015). Thus, the baseline electricity cost was analyzed from July 2016 through March 2017.

During this analysis period, EWA's monthly power purchase from SDG&E ranged from 167,300 kWh (November 2016) to 341,770 kWh (September 2016). The average monthly kWh purchase during this period was 226,900 kWh

SDG&E bills EWA on a monthly basis, and the costs are a summation of a variety of charges, including:

- Electricity generation: cost per kWh for the source generation of consumed electrical energy.
- Electricity delivery: cost per kWh for the transmission and distribution of consumed electrical energy.
- On-peak demand: cost per kW for the maximum 15-minute power demand during peak periods.
- Non-coincident demand: cost per kW for the maximum 15-minute power demand during non-peak periods (non-coincident with the maximum grid demand).
- Standby demand: fixed charge per kW of on-site generator capacity for SDG&E to reserve an equivalent amount of grid system capacity in the event of a generator shutdown—charged every month whether used or not.

The breakdown of each bill is provided in Figure 3-5.

Figure 3-5. Breakdown of monthly SDG&E bills

As shown in the figure above, the majority of the SDG&E bill are charges for non-coincident (NC) demand and standby demand. On average, from July 2016 to March 2017, NC demand plus standby demand constituted 71.3 percent of the total SDG&E electricity bill. The standby demand is based on an installed capacity of 2,295 kW. Average cost for electricity calculated in dollars per kWh (\$/kWh), when all charges were included (total usage [kWh]/total electric charge), ranged from \$0.24 to \$0.40 \$/kWh. If NC and standby demand charges are excluded, the calculated value drops to \$0.09 to \$0.10 \$/kWh.

#### 3.1.2.1 SDG&E Electric Rate Schedule

In April 2016, SDG&E implemented, and EWA adopted, a revised time of use (TOU) electric rate schedule called TOU Plus. This new schedule incorporated a demand response element into a normal TOU rate schedule; a summary is provided below.

- Customers select a Capacity Reservation, in kW, with an associated monthly payment of \$6.14/kW
- Up to 18 times a year, the utility calls for Critical Peak Pricing Event Days; during these days, any demand in excess of the Capacity Reservation is billed at a much higher rate
- The EWA has a capacity reservation of 0 kW, meaning no reservation charges are added and no capacity is reserved for peak days

Brown and Caldwell recommends an evaluation of the most applicable rate schedule for EWA as part of the current energy planning effort.

### 3.2 Biogas Production and Use

The plant measures biogas production from each individual operating digester gas lateral (4, 5, and 6) as well as biogas usage in the engines, dryer, and waste gas flare. Historical data from the 'Gas Data Monthly' information was used to compare the biogas production and usage. In theory, the total production should equal the usage (including wasting), however, data from the baseline period indicates that the digesters produced an average of 521 standard cubic feet (scf) per minute (scfm) of biogas while only 473 scfm was utilized. Another source of digester gas data was from the historical SCADA data. The individual digesters indicate that the digesters produce an average of 502 scfm. Biogas flow meters located closer to the digesters are notorious for inaccuracy, therefore, a third approach using a common VSR calculation was performed. Figure 3-7 illustrates the variance between biogas production and use.

The VSR calculation uses assigned percent VS and VSRs for each digester feedstock (PS, TWAS, FOG) to determine the quantity of VS destroyed in the digester. For every pound of VS destroyed, it was assumed that 18 cubic feet of digester gas are produced. Applying the VSR method to the digester solids loading resulted in a biogas production of 501 scfm, which is more consistent with the end use meters and falls between the range of the production meters and end use meters. The biogas production will be based on the VSR method and is summarized in Table 3-2 in terms of energy, volume, and flowrate.

Table 3-2. Biogas Production Summary					
	Annual Production, MMscf	Average Flowrate, scfm			
Baseline	1,580,000	263.3	501		

<sup>&</sup>lt;sup>1</sup> Assuming 600 Btu/cf HHV for biogas MMscf = million standard cubic feet.

Biogas is used to either fuel the internal combustion (IC) engines, supplement gas demands in the solids dryer, or is wasted through the flare. Figure 3-6 shows the baseline quantity of biogas that is used for each process during the baseline period. Biogas usage in November 2015 is included in the graphical figure but will not be used to determine the baseline biogas use since it was an anomaly month where most of the biogas was flared. Since the solids dryer operates 11 days on, 3 days off, 3/14 of the time, excess biogas not utilized in the engines is flared while the dryer is not operational. Additionally, the gas control valve to the dryer is manually set rather than automated, which results in flaring of biogas when production is high. Brown and Caldwell recommends automating the control valve to allow the dryer to operate on blended biogas and natural gas rather than flaring biogas.

Figure 3-6. Biogas usage during Baseline Period (June 2016 to May 2017)

Figure 3-7. Biogas summary: usage and production

## 3.3 Natural Gas Analysis

This section summarizes the natural gas analysis conducted to support the calculated baseline values during June 2016 to May 2017, which includes evaluations of natural gas usage and cost.

#### 3.3.1 Natural Gas Usage

Natural gas usage is recorded for both plant totals and individual processes. Natural gas is used at the plant for a variety of uses in the following processes:

- Electrical power production in internal combustion engines (directly and through Eclipse blending unit)
- Heat dryer plant operates 11 days on, 3 days off.
- Regenerative thermal oxidizer (RTO) (as part of the sludge dryer exhaust treatment)
- Space and water heating in the Administration and Maintenance Buildings
- Flare pilot

Natural gas purchases are recorded by a master meter and reported in scf by EWA and therms in the monthly invoices. EWA also maintains several internal natural gas meters which were used to develop the baseline natural gas use throughout the plant. EWPCF's natural gas meters recorded usage data that was consistent with the SDG&E billing statements.

Figure 3-8. Natural gas use by process/location at EWPCF

Table 3-3. Natural Gas Baseline Use in Therms							
Engine Pilot Flare Heat Dryer RTO Admin Bldg. Maintenance Bldg.							Total
June 2015 to May 2016*	132,140	5,857	745,562	45,076	22,906	405	951,546
June 2016 to May 2017	115,630	5,986	507,894	39,294	26,841	11	695,656

<sup>\*</sup>Excluding November 2015 in which natural gas use in the engines was significantly greater than other months, likely due to an operational change.

Totalized natural and digester gas use from both the heat dryer and RTO was used along with totalized digester feed loading to determine a directly proportional relationship between the two for prediction of future gas demands. Since the relationship between natural gas demand and solids drying is not affected by the replacement of aeration basin diffusers, the data used spans over a longer period to provide a better average gas demand per pound of solids. Between the months of February 2016 to May 2017, excluding April 2017, a total of 36.5 million pounds of solids were fed to the digesters while the heat dryer and RTO consumed a total of 85,100 million Btu (MMBtu) worth of natural and digester gas. Energy used to pre-heat the dryer is approximately 2 MMBtu per hour (MMBtu/hr) for 30 minutes; therefore, each time the dryer starts up, 1 MMBtu is consumed. Over the course of a year, this equates to roughly 26 MMBtu, which is less than 1 percent of the typical energy demand. Therefore, it can be assumed that the dryer gas consumption is nearly linear to solids loading. Assuming the dryer and RTO do not consume energy when there is no solids

load, a direct relationship between the two can be established at 0.0023 MMBtu consumed per pound of solids processed.

#### 3.3.2 Natural Gas Costs

EWA purchases natural gas from the Department of General Services Natural Gas Program (DGS) and the costs are calculated as a unit cost per therm. For the cost analysis, EWA provided monthly billing data from May 2015 through March 2017. The total natural gas purchased by the EWPCF during the period between May 2015 through March 2017 was 1,633,000 therms. In-plant monitoring during that same period reported a usage of 1,610,000 therms—about 1 percent lower. The difference in recorded values is within acceptable tolerances for analysis and shows good agreement on flow meter accuracy.

The therms purchased from DGS during that period ranged from 48,600 therms (January 2017) to 120,100 therms (November 2015), and averaged 71,000 therms per month. The per unit commodity cost for natural gas during the same period fluctuated month by month, ranging from \$0.24 to \$0.39 per therm, with an average of \$0.31 per therm. After adding transportation, load management, and DGS service fees, the per unit rate increases to range of \$0.38 to \$0.56 per therm, with an average of \$0.44 per therm. A breakdown of monthly natural gas costs per process is provided in Figure 3-9.

Figure 3-9. Natural gas costs per process/location at EWPCF

EWA's average cost of natural gas of \$0.44 per therm through a separate natural gas procurement mechanism is substantially less than the alternative of at least \$0.62 per therm through SDG&E's GN-3 natural gas rate schedule.

#### 3.4 Heat Production and Use

Heat is produced at the plant via the engines and solids dryer. A portion of the heat produced by the engine is transferred to the plant's hot water loop and is utilized by the anaerobic digesters and an absorption chiller. The plant intends on transitioning from the absorption chiller to a conventional heating, ventilation, and air conditioning system; therefore, these demands will not be accounted for in future baseline heat demand. Engine exhaust heat that is not recovered to the plant's hot water loop is wasted to the plant's effluent and excess heat produced by the solids dryer is wasted to atmosphere as hot exhaust.

Available heat that can be recovered from the engine is estimated to be 40 percent of the fuel input for both jacket water recovery and exhaust recovery since historical data was not provided. With two 750 kW engines running at full output, approximately 6.0 million MMbtu/hour can be recovered. Currently, there is no method for capturing and utilizing waste heat from the RTO and all of the heat is wasted to the atmosphere as exhaust.

The baseline heat production and usage summarized in Table 3-4. Digester heat demand is based on an estimate from EWA's 2011 Energy and Emissions Strategic Plan.

Table 3-4. Heat Production and Usage					
Production, MMBtu/hr Usage, MMBtu/hr					
Engines	6.0	N/A			
Dryer/RTO	1.4	N/A			
Digesters	N/A	1.2			
Total	7.4	1.2			

## **Section 4: Future Conditions**

Recently, the PMP determined the projected solids loading to EWPCF utilizing population growth projections as a means of determining future flows and loads as well as the historical trends method. Annual growth was provided by San Diego Association of Governments for use in the PMP. The projections were then incorporated as the influent loading and modeled through BIOWIN to obtain the WAS and PS loadings to the digesters. As part of Task 1, Brown and Caldwell reviewed EWPCF's historical data, comparing it to the PMP. This section will review the projected solids flows and loads. Furthermore, this section will review the projected energy demand and production, biogas production, natural gas use, and heat production based on estimated future loads. Finally, Brown and Caldwell will present the peaking factors that will be used for future analysis and design.

### 4.1 Solids Flows and Loads

With aggressive water conservation efforts in California, projecting flows in a wastewater treatment plant can be challenging. Solids loading to the facility, however, can be estimated as it scales with population growth. In that regard, Brown and Caldwell projected solids loads utilizing linear interpolation. The current loads

determined in the mass balance and the growth rate from the PMP were used to create a linear expression. Table 4-1 summarizes the projected loads determined by Brown and Caldwell for 2020, 2030, and 2040. Table 4-2 summarizes the flows associated with the annual average solids loadings. Figure 4-1 compares the solids projection curve from the PMP to the one developed in this study. The loads shown here for current conditions are based on the calibrated mass balance presented in Section 2, They are higher than the loads projected in the PMP because influent loadings to the plant were likely underestimated in the PMP due to the use of non-representative grab samples. A rate of increase was applied to the 2017 loads determined by using the calibrated mass balance, on par with the rate used in the PMP, per EWA's direction. The projection rate used in the PMP was based on applying an annual population growth rate of 0.74 percent to the influent flow and modeling the subsequent solids production rates.

Table 4-1. Projected loads for PS and WAS						
Current 2020 2030 2040						
PS, ppd	47,500	50,600	60,800	71,100		
WAS, ppd	29,400	31,600	39,000	46,300		

Table 4-2. Projected Flows for PS and WAS							
Current         2020         2030         2040							
PS, MGD <sub>1</sub>	0.13	0.14	0.17	0.20			
WAS, MGD <sub>2</sub>	0.71	0.76	0.94	1.11			

<sup>&</sup>lt;sup>1</sup> PS assumes a total solids content of 4.3 percent

<sup>&</sup>lt;sup>2</sup> WAS assumes a total solids content of 0.5 percent

Figure 4-1. Solids projections determined from the 2016 PMP and 2017 BEE Plan

To project the energy and gas use and production, the projected PS and WAS were used to determine digester feed. Primary sludge remained as is at 4.3 percent solids. The WAS was thickened in the DAF at an assumed 95 percent capture rate. Finally, the FOG was assumed to be the same as the current load. These values are summarized in Table 4-3.

Table 4-3. Projected Solids Feed to the Digester							
	Current 2020 2030 2040						
PS, ppd	47,500	49,800	57,500	65,200			
TWAS, ppd	27,900	29,900	36,600	43,200			
FOG, ppd	4,000	4,000	4,000	4,000			
Combined Digester solids load, ppd	98,100	112,400					

## 4.2 Energy Production and Use

Based on the analysis of existing energy usage, 79 percent of the power consumed at the plant is dependent on flow and administrative uses, with 21 percent of the total energy use related to solids loading. As the solids loading projections at the plant increase, so too will the percentage of total energy associated with solids treatment. Energy projections are summarized in Table 4-4. The projected energy demands for each decade are also plotted on Figure 4-2 alongside the historical data presented earlier.

Table 4-4. Projected Energy Demand					
Current 2020 2030 2040					
MWh/year	16,000	16,000	16,600	17,200	
kWh/day	44,000	43,900	45,500	47,100	

Figure 4-2. Projected Daily Energy Demand for 2020, 2030, and 2040

Until a decision has been made regarding EWA's request to modify the air permit to allow for the operation of three engines, it is assumed that the plant will continue to operate the engines as they do currently. Therefore, the baseline and future projections assume 1,500 kW of continuous engine output.

## 4.3 Biogas Production and Use

Biogas projections are expected to increase at a proportional rate based on the solids projections—for every pound of VS destroyed in the digesters, an additional 18 cubic feet of biogas will be produced, which is consistent with the historical data. A VSR of 60 percent was assumed in the projections, which aligns with the current biogas meter data. The biogas projections are summarized in Table 4-5.

Table 4-5. Projected Biogas Production					
Current 2020 2030 2040					
scfm	501	544	703	766	
therms/year	1,581,000	1,666,000	1,951,000	2,235,000	

Biogas can be used in the IC engines to generate enough power to meet the plant's demands; however, this is pending EWA's August 2017 request to revise the air permit for operation of three IC engines. Until a decision has been reached regarding the permit modification, it is assumed the engines will run on biogas, with the remainder of gas used in the solids dryer. See Section 4.4 for biogas use in the heat dryer and RTO.

### 4.4 Natural Gas Use

Natural gas and digester gas use in the heat dryer and RTO is expected to increase as solids loading to the digesters increase. Based on the relationship developed between the two in Section 3.3.2, projected gas demands for 2020, 2030, and 2040 are 71,200, 83,500, and 95,700 MMBtu per year, respectively. Use in the engine will vary depending on the quantity of biogas available as solids loading projections increase and depending if the plant can operate a third engine on biogas. Therefore, use of additional natural gas as engine fuel is not included in the projected values noted previously. The administration and maintenance buildings and pilot flare are expected to remain constant and are not flow dependent.

#### 4.5 Heat Production and Use

Heat production is expected to remain constant in the engines since operating conditions are assumed to match the existing baseline. Heat production in the solids dryer and RTO is expected to increase proportional to the increased solids loading to the dryer presented in Section 4.1. Likewise, digester heating projections are scaled proportionally to the projected flows for PS, TWAS, and FOG to the digesters in referenced in Section 4.1. These projections are conservative in that roughly 20 percent of the heat demand is typically lost through the digester shell, with about 80 percent used to warm-up the incoming sludge. Theoretically, shell losses should remain constant and only sludge heating projections would increase. A summary of these heat projections is summarized in Table 4-6.

	Table 4-6. Heat Production and Usage Projections in MMBtu/hr								
	Base	eline	2020		20	2030		2040	
	Production	Usage	Production	Usage	Production	Usage	Production	Usage	
Engines	6.0	N/A	6.0	N/A	6.0	N/A	6.0	N/A	
Dryer/RT0	1.4	N/A	1.49	N/A	1.80	N/A	2.11	N/A	
Digesters	N/A	1.2	N/A	1.28	N/A	1.55	N/A	1.81	
Total	7.4	1.2	7.49	1.28	7.80	1.55	8.11	1.81	

## 4.6 Peaking Factors

In addition to determination of the flows and loads projections, the solids projection peaking factors were established. Sufficient data were unavailable to accurately determine the solids peaking factors as total and VS are only analyzed weekly. Brown and Caldwell will use the peaking factors previously determined in the PMP for peak month and peak day. Peak 14 day and Peak 7 day were determined based on historical data and engineering judgment.

Table 4-7. Summary of Peaking Factors						
Peak Month <sup>1</sup> Peak 14 day Peak 7 day Peak day <sup>1</sup>						
PS	1.23	1.3	1.4	1.60		
WAS	1.23	1.3	1.4	1.60		
Combined Sludge	1.23	1.3	1.4	1.60		

<sup>&</sup>lt;sup>1</sup> Values referenced from the PMP.

### 4.7 Conclusions

The data discussed in this TM will be used as the basis for future work in the BEE Plan. This includes identifying capacity issues in the solids handling system. Solids and energy demand projections will be used to size corresponding process units in the development of alternatives under Task 7.

## **Executive Summary**

The Encina Wastewater Authority (EWA) is developing a plan to expand solids-processing capabilities due to near-term capacity issues in the heat dryer at the Encina Water Pollution Control Facility (EWCPF), maximize resource recovery capabilities for EWA, and optimize the facility's energy production. This Technical Memorandum (TM) 2 describes the development of screening and evaluation criteria used to assess biosolids treatment technologies for solids handling.

#### **Evaluation Process**

Treatment technologies were evaluated for thickening, stabilization, dewatering, and post-dewatering processes. Technologies were selected for further evaluation through the three-step process described below.

### Step 1: Biosolids End-Use Pre-Screening

Step 1 assessed viable end uses for a range of biosolids products. Technologies that passed the end-use filter are listed in Table ES-1. Technologies that did not generate viable beneficial uses in the Southern California region were eliminated from further consideration.

Table ES-1. Biosolids Treatment Technologies Selected for Evaluation					
Thickening Tech	nologies	Stabilization Technologies	Dewatering Technologies	Post-Dewatering Technologies	
<ul> <li>Primary Clarifier</li> <li>DAFT</li> <li>RDT</li> </ul>		Mesophilic digestion Mesophilic high-solids digestion Acid/gas digestion Staged digestion Thermophilic digestion TPAD Enzymatic hydrolysis Chemical hydrolysis Lystek THP: Class A THP: Exelys-DLD THP: SolidStream Cambi	<ul> <li>Centrifuge</li> <li>BFP</li> <li>Screw press</li> <li>Volute press</li> <li>Bucher press</li> </ul>	<ul> <li>Drum dryer</li> <li>Indirect dryer</li> <li>Gasification</li> <li>Pyrolysis</li> <li>Partial solar drying</li> <li>Deep-well injection</li> <li>Dehydration</li> <li>Incineration</li> </ul>	

BFP = belt filter press; DAFT = dissolved air flotation thickener; RDT = rotary drum thickener; THP = thermal hydrolysis process; TPAD = temperature-phased anaerobic digestion.

#### Step 2: Fatal-Flaw Screening

Step 2 involved the development of fatal-flaw criteria, for which a technology would pass or fail. Treatment technologies had to meet the following fatal-flaw criteria to be considered for further evaluation:

- There must be at least one full-scale installation of the technology at a wastewater treatment plant (WWTP) in North America
- There must be at least one successful installation of the technology at a facility of similar size to EWPCF to ensure compatibility

- The technology must be accommodated within EWPCF's limited available footprint
- The technology must be capable of being integrated into the existing treatment infra-structure

### Step 3: Ranking of Screened Technologies

EWA previously evaluated thickening technologies in its Process Master Plan (PMP). Thus, EWPCF's current thickening (primary clarifiers for primary sludge [PS] and dissolved air flotation units for waste activated sludge [WAS]), and the recommended thickening process from the PMP (rotary-drum thickeners) were all advanced without further evaluation by the Brown and Caldwell (BC) team.

Stabilization and dewatering technologies that passed the fatal-flaw screening were further assessed using the evaluation criteria listed in Table ES-2, which were developed to reflect EWA's values and project goals. The pre-screened technologies were ranked based on these criteria in a workshop with EWA staff, held on August 16, 2017.

Table ES-2. Biosolids Treatment Technologies Evaluation Criteria				
Criterion	Description			
End-use market compatibility	Onsite technology directly produces one of the recommended product alternatives			
	Alternatively, onsite technology product compatible with product alternatives			
Proven technology performance	Proven and reliable technology with same configuration intended at EWCPF			
	Long-term successful operating track record			
Minimize life-cycle costs	Qualitative metric of program cost			
	Capital and O&M costs based on existing EWA data or similar experience at other WWTPs			
	Potential revenues from sales			
	Product/market geographic proximity			
Energy/resource recovery	Biogas production increased through advanced digestion			
	Co-digestion of organic waste supported			
	Renewable energy recovered			
	Biosolids product beneficially reused			
O&M impacts	Impacts to existing WWTP O&M staff levels			
	Complexity of new technology O&M and control systems			
	Reliability of new technology (potential downtime)			
	Minimal impacts to WWTP safety			
Environmental impacts	Impacts to carbon footprint and air permitting			
Community and stake-holder impacts   • Minimal nuisance impacts such as dust, odors, vectors, aesthetics, noise, and traf				
	Impacts to partner agency issues/values, and local planning codes and requirements			
Project site compatibility	Compatibility of technology with available WWTP footprint			
	Incorporation into existing treatment process			

O&M = operations and maintenance

**Stabilization Technologies.** Thermophilic digestion scored the highest, followed by mesophilic digestion and Class A thermal hydrolysis process (THP). Thermophilic digestion yields a dewatered Class B cake that can be beneficially used in agriculture in Arizona or sent to regional compost facilities for further processing, and has proven long-term performance records at WWTPs of various sizes. Thermophilic digestion provides the greatest potential to minimize life-cycle costs through revenue generated by importing high-strength waste. Thermophilic digestion also delivers greater proportional gas yield than the other technologies as compared to the relatively modest increased energy demand.

**Dewatering Technologies.** Belt filter presses (BFPs) scored the highest, followed by centrifuges. The evaluated technologies scored similarly in three of the criteria: life-cycle costs, environmental impacts, and community and stakeholder impacts. Differentiating criteria in this technology category included end-use market compatibility, proven technology performance, operations and maintenance (O&M) impacts, and project

site compatibility. With respect to proven technology performance, BFPs and centrifuges are the most widely used dewatering technologies in the United States. With respect to end use, research suggests that low-shear dewatering processes, like BFPs, yield cake with lower odors than high-shear processes like centrifuges.

## **Implementation Considerations**

Thermophilic digestion occupies essentially the same footprint as mesophilic digestion, which is the stabilization process currently used at EWPCF. More heat exchanger capacity would be needed for thermophilic digestion, which could be accomplished by replacing the existing units with taller, higher-capacity units.

Two thermophilic scenarios will be explored in the alternatives analysis phase: (1) a 15-day thermophilic process, which guarantees Class B quality, but is limited by the ability to receive high-strength waste based on hydraulic capacity, and (2) a 10-day process, which allows EWA to receive greater quantities of high-strength waste. A new receiving station could be constructed to accommodate the increased quantities of waste.

One of the major questions to be addressed is whether a second thermal dryer is necessary to meet EWA's goals. As the existing building is space-constrained, a new building may need to be constructed to accommodate a second dryer, although efforts are underway to identify building modification alternatives. Ultimately, in the event construction of a new building was deemed desirable, the BC team prepared preliminary layouts for the second dryer that require demolition of the existing dissolved air flotation thickeners (DAFTs). Thus, if a second thermal dryer is required, thickening upgrades would need to be performed prior to the installation of the second dryer.

## **Next Steps**

The biosolids treatment technologies selected through this screening process will be included in end-to-end project alternatives to expand solids-processing capabilities at EWCPF. Technology combinations, shown in Figure ES-1, will be combined with the results of Tasks 3, 4, and 5 to create end-to-end alternatives for further analysis. The three stabilization alternatives—mesophilic digestion, thermophilic digestion, and Class A THP—will each be evaluated with and without a second thermal dryer. Development of end-to-end alternatives will be performed in cooperation with EWA staff prior to analysis.

Figure ES-1. Biosolids treatment technology options for EWCPF end-to-end project alternatives.

### **Section 1: Introduction**

The EWA is developing a Biosolids Energy and Emissions (BEE) Plan, which will serve to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed PMP. The BEE Plan has several goals:

- Provide a comprehensive analysis of all project elements, including solids treatment, waste heat handling, gas processing, and energy generation and use
- Address capacity limitations in the solids and gas handling processes, energy and emissions at the EWPCF
- Assess which alternative is likely to be the most cost-effective and sustainable solutions for EWA
- Move the EWPCF toward greater energy efficiency and independence
- Reduce greenhouse gas (GHG) emissions

The outcome of this process is an implementable plan resulting in capital improvements to expand system capacities as needed and appropriate, maximize resource recovery capabilities for EWA, and optimize energy production. Under Task 2 of the BEE, the BC team developed a methodology for screening and evaluating technologies for solids handling. Technologies were evaluated for thickening, stabilization, dewatering, and post-dewatering. Stabilization technologies evaluated included alternatives for production of Class A and Class B biosolids. Recommended technologies selected under this task will be advanced for further analysis and will be combined with gas use, energy production, and waste heat alternatives developed under Tasks 3 through 5. This TM describes the evaluation methodology for solids processing and biosolids technologies, the technologies evaluated, and how these technologies were screened and ranked. Screening and ranking of technologies was performed in a workshop with EWA staff, held on August 16, 2017. Meeting minutes from this workshop are provided as Attachment A.

This TM is preceded by TM 1, which addressed the baseline energy profiles and projections, established a mass balance for the solids-handling system, and defined solids projections which are used in the PMP. Calculations performed and discussed in TM 2 are based on the values defined in TM 1.

## **Section 2: Evaluation Methodology for Biosolids Technologies**

The BC team developed a three-part evaluation process for assessing solids processing technologies. The first two parts, described in Sections 2.1.2 and 2.1.3, were performed under Task 2. Use of the Solids Water Energy Evaluation Tool (SWEET) will be performed under Task 7.

The approach to evaluating solids technologies involved a three-step process outlined here:

- First, a pre-screening step incorporating biosolids end-use considerations was performed. Biosolids end use in California is highly regulated and can be complicated. Thus, it is important to incorporate considerations for those technologies that generate a desirable end product that can be beneficially used. These end-use considerations eliminated certain technologies from consideration.
- Next, the selected technologies from the pre-screening step were then evaluated through a fatal-flaw analysis.
- Finally, those technologies that passed the fatal-flaw test were evaluated and ranked using evaluation criteria developed in conjunction with EWA.

These three steps are described in more detail in the following sections.

#### 2.1 Role of Biosolids End Use

By starting with biosolids end use, the BC team evaluated only those technologies that would generate a product suitable for beneficial use in the region. Beneficial use generally refers to those end uses that avoid landfill disposition and provide a benefit, such as soil conditioning or carbon sequestration. While use of biosolids in alternative daily cover has historically been considered a beneficial use, CalRecycle has stated that it intends to phase out this definition in support of overall policies encouraging the diversion of organics from landfills. Other typical beneficial uses include:

- Cement kilns: Biosolids have been used in cement plants to produce clinker, the main component of cement, which is an energy-intensive operation. Biosolids have recoverable calorific value that can be used as fuel in making cement—replacing a portion of conventional fossil fuels—if they meet industry specifications. While biosolids have a lower heating value than coal, and generate more ash per British thermal unit (Btu) than coal, biosolids also contain useful minerals that are incorporated into the clinker to make cement.
- Land reclamation: Across the United States, biosolids have been used to reclaim marginal lands including abandoned mines and fire ravaged lands. In this particular end use, large quantities of biosolids are used for a limited period (no more than a few years) to remediate a given parcel or parcels of land. In California, the U.S. Environmental Protection Agency (EPA) Region IX has expressed interest in the use of Class A biosolids to remediate damaged lands.
- Bulk agriculture: Use of biosolids in land application is a common and well-established practice in California; more than 60 percent of biosolids generated in the state are managed this way. Land application provides beneficial use of biosolids, applied at agronomic rates as a soil amendment in agriculture.
- Bulk horticulture and landscaping: Class A biosolids can be used in horticultural activities such as landscaping and nursery production (e.g., sod production, establishment of field beds, preparing container mixes for specialty plants, etc.). Products grown in these applications generally have a higher value than those in bulk agriculture and include ornamental flowers, trees, and shrubs.

- Fertilizer blending: Commercial fertilizer blenders enhance dried biosolids with micro- and macronutrients and then package and market the blend for sale in retail outlets. Blending requires a hard,
  size-graded pellet or granule product of the type that is typically produced by drum dryer systems.
   Fertilizers have additional regulatory oversight and requirements by the California Department of Food
  and Agriculture (CDFA).
- Soil blending: Commercial soil blenders mix native soils, organics, and other ingredients such as sand to produce custom soil blends for a variety of non-agricultural uses, such as in construction, landscaping, and development of green infrastructure. Using dewatered Class A biosolids as an ingredient in the production of blended landscape soils is a newer biosolids management technique.
- Local distribution: Some utilities have been able to successfully distribute Class A biosolids products directly to residents and/or to local users (e.g., road and highway departments, establishment of street trees). This typically requires a value-added Class A product, such as granules, compost, or soil blend, that shares characteristics with commercially available amendments rather than dewatered cake.

Based on market research performed recently by the BC team, EWA's size (i.e. capacity, solids production) makes it difficult to access cement kilns, as EWA has experienced in the past, which require larger volumes of biosolids for use in onsite energy generation. Land reclamation is a practice more common in the northeastern United States, and typically requires large volumes of biosolids over a relatively short period. Bulk agriculture is the primary end use for California biosolids, although it is important to note that some local county ordinances restrict the use of biosolids. Thus, many Southern California wastewater agencies, including EWA, send their biosolids to western Arizona for agricultural land application. Class B biosolids cannot be land-applied in Southern California, while some counties do permit land application of Class A biosolids. A map of the county ordinances, created by the California Association of Sanitation Agencies (CASA), is provided in Attachment B.

Bulk horticulture and fertilizer blending have both been destinations for EWA's dried granules. Bulk horticulture has also absorbed some Class A compost generated by regional composting facilities. Soil blending is a well-established practice, but experience with using biosolids in blends is limited to a few facilities using Class A compost generated by the Inland Empire Regional Compost Facility.

Viable beneficial uses were paired with biosolids products, which in turn were linked to onsite solids-handling processes. The exception is offsite composting—capacity in regional composting facilities exists for the offsite conversion of Class B cake to Class A compost. Stabilization processes were defined generally (e.g., Class A digestion) and, in some cases, several processes will yield a given product, as discussed in greater detail in Section 3.2. These stabilization processes form the starting point for the biosolids technology evaluation. Table 2-1 summarizes the relationship between stabilization processes, relevant post-dewatering processes, products, and beneficial uses.

Stabilization Process	Post-Dewatering Process	Resulting Product	Associated Beneficial Use(s)
Class B digestion	None	Class B cake	Bulk agriculture (Arizona only)
Class B digestion	Class A composting (off site)	Class A compost	Bulk agriculture Bulk horticulture Soil blending Local distribution
Class B digestion	Thermal drying	Class A granules	Bulk agriculture Bulk horticulture Fertilizer blending Soil blending Local distribution
Class A digestion	None	Class A cake	Bulk agriculture Soil blending Land reclamation
Class A THP	None	Class A THP cake	Bulk agriculture Bulk horticulture (with aging) Soil blending Land reclamation

## 2.2 Fatal-Flaw Screening

Beginning with the end use, acceptable biosolids technologies capable of generating products for beneficial use were identified. These technologies were then examined through a fatal-flaw filter, which was applied uniformly across all technologies: biosolids, alternative power production, and waste heat use. The four criteria below were developed in conjunction with EWA staff:

- At least one successful North American installation of technology: There must be at least one full-scale
  installation of the technology at a WWTP in North America.
- At least one successful installation in a facility of similar size: The technology should be sufficiently
  developed that it is applicable at a facility of comparable size to EWPCF to ensure compatibility.
- Available space: The technology must be accommodated within the limited available footprint at EWPCF.
- Compatibility with plant site and any existing equipment: The technology must be capable of being
  integrated into the existing WWTP infrastructure.

A discussion of how the fatal-flaw criteria were applied to individual treatment technologies is provided in Section 3.

### 2.3 Evaluation Criteria Development and Ranking

For those technologies that passed the fatal-flaw filter, further evaluation and ranking was performed. The BC team worked with EWA staff to develop a series of evaluation criteria that reflect the project goals, EWA's values, and EWA's general operational practices. Criteria weights were assigned in a workshop with EWA staff. Criteria are presented in Table 2-2. These criteria were applicable for stabilization technologies. The "energy/resource recovery" criterion was not applicable for the dewatering technologies, which results in a different weighting system. Table 2-3 presents the two different weights associated with the stabilization and dewatering technologies. Evaluation of individual biosolids technologies is discussed in Section 4.

Table 2-2. Biosolids Technology Evaluation Criteria					
Criterion	Description	Scoring Description			
End-use market compatibility	Onsite technology directly produces one of the recommended product alternatives Alternatively, onsite technology product is compatible with product alternatives	Low-score indicates technology product that has not been identified as part of the product list and is not compatible with the product list  High-score indicates technology product that is compatible with Class B cake, Class A cake, Class A			
Proven technology performance	Proven and reliable technology with same configuration intended at EWPCF Long, successful operating track record	THP cake, and dried Class A pellet  Low-score indicates no successful large-scale operating installations in North America or Europe, no successful demonstration-scale installations in North America or Europe, and unknown safety or reliability record  High-score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, a track record duration > 5 years, and vendors in western United States			
Minimize life-cycle costs	Qualitative metric of program cost  Capital and O&M costs based on existing EWA data or similar experience at other WWTPs  Potential revenues from sales  Product/market geographic proximity	Low-score indicates high capital cost to build onsite facilities, high 0&M costs, expensive end-use market, and high transportation costs  High-score indicates low capital cost to build onsite facilities, low 0&M costs, potential product revenue, and product destination within 100 miles			
Energy/resource recovery	Increases biogas production through advanced digestion Supports co-digestion of organic waste Recovery of renewable energy Beneficial use of biosolids product	Low-score indicates high energy requirement for onsite technology, no increase in biogas production, technology does not recover energy as biogas, no recovery of renewable energy in biosolids, and no biosolids resource recovery  High-score indicates a higher biogas production, compatible with co-digestion of organic waste, and biosolids resource recovery			
O&M impacts	Impacts to existing WWTP O&M staff levels Complexity of new technology O&M and control systems Reliability of new technology (potential downtime) Minimal impacts to WWTP safety	Low-score indicates more 0&M time required, complex mechanical and control systems required compared with existing WWTP facilities, potential equipment downtime, and new chemicals or hazards High-score indicates reduction in 0&M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new chemicals or hazards			
Environmental impacts	Impacts to carbon footprint and air permitting	Low-score indicates high carbon footprint for technology, high travel distance to end use, difficult to treat sidestreams, and new permitting for environmental regulatory requirements  High-score indicates low carbon footprint for technology, low travel distance to end use, minimal sidestream generation or impacts, and no additional permitting for environmental regulatory requirements			

Table 2-2. Biosolids Technology Evaluation Criteria				
Criterion	Description	Scoring Description		
Community and stakeholder impacts	Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic	<b>Low-score</b> indicates that nuisance factors for onsite technology are difficult to mitigate		
	Assess impacts to partner agency issues/values as well as local planning codes and requirements	<b>High-score</b> indicates that nuisance factors can be mitigated at WWTP site		
	Assess compatibility of technology with available WWTP footprint Incorporation into existing treatment process	Low-score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing WWTP		
Project site compatibility		High-score indicates available footprint for new facilities and maintains space for future facilities, and ease of integration with existing processes and facilities		

O&M = operations and maintenance

Table 2-3. Biosolids Technology Evaluation Criteria Weighting Values				
Criterion	Stabilization Weight	Dewatering Weight		
End-use market compatibility	15%	15%		
Proven technology performance	15%	25%		
Minimize life-cycle costs	10%	20%		
Energy/resource recovery	20%	N/A		
O&M impacts	10%	15%		
Environmental impacts	10%	5%		
Community and stakeholder impacts	10%	5%		
Project site compatibility	10%	15%		

## 2.4 Solids-Water-Energy-Evaluation Tool

Under Task 7, biosolids treatment technologies will be combined with biosolids beneficial use, alternative power production, and waste heat technologies to create holistic end-to-end alternatives. BC's SWEET will be used to efficiently evaluate the feasibility and energy and economic profiles of brainstormed alternatives, and compare those alternatives with the current program to provide a baseline for measurement. SWEET tracks volatile solids (VS), inert solids, and water through potential process alternatives and considers energy required to power/heat those processes and forecast energy production and material recovery. It also allows comparison of energy balances with integration of multiple feedstocks, and estimation of the carbon footprint of each alternative. Two notable advantages of SWEET include its ability to evaluate alternatives in real time during workshops and its transparency of all the factors used.

Key model outputs to facilitate alternative selection included:

- Capital costs
- Operations and maintenance (O&M) costs
- Economic net present value

Another advantage of SWEET is that it allows for an iterative evaluation process; if aspects of certain alternatives appear to provide strong benefits; these aspects can be incorporated to create an optimized set of alternatives for evaluation. In this evaluation, the iterative evaluation is used to develop the most advantageous program for EWA.

## **Section 3: Identification of Biosolids Technologies**

Table 3-1 contains a general description of the technologies needed to generate the desired end products. Specific thickening, digestion, dewatering, and post-dewatering technologies identified in

Workshop 2 with EWA staff are summarized in Table 3-1. Descriptions of each of the identified technologies follow in this section. Some technologies were eliminated at the outset. Although a number of technologies could be accommodated at the site, EWA staff were comfortable with the recommendation from the PMP to install rotary-drum thickeners (RDTs) for the thickening process. In the alternatives evaluation, these will be compared against the currently installed thickening equipment. With respect to stabilization processes, several processes were eliminated from the outset. Lime stabilization was briefly considered but produces an odorous product in a region where agricultural demand for lime is low. In addition, it would require installation of new equipment at EWPCF, including appropriate odor control. Aerobic digestion was also considered but is not compatible with the size of EWPCF or the energy goals of EWA.

Table 3-1. Biosolids Treatment Technologies Selected for Evaluation				
Thickening Technologies	Stabilization Technologies	Dewatering Technologies	Post-Dewatering Technologies	
Primary clarifier	Mesophilic digestion	Centrifuge	Drum dryer	
DAFT	Mesophilic high-solids digestion	BFP	Indirect dryer	
RDT	Acid/gas digestion	Screw press	Gasification	
	Staged digestion	Volute press	Pyrolysis	
	Thermophilic digestion	Bucher press	Partial solar drying	
	TPAD		Deep-well injection	
	Enzymatic hydrolysis		Dehydration	
	Thermo-chemical hydrolysis		Incineration	
	Lystek			
	Class A THP			
	Exelys THP: DLD			
	THP: SolidStream Cambi			

BFP = belt filter press; DAFT = dissolved air flotation thickener; TPAD = temperature-phased anaerobic digestion

## 3.1 Thickening Technologies

Selection of a thickening process is critical to the design and performance of downstream digestion. The more efficient the thickening process is, the more concentrated the solids being sent to digestion are, allowing for better digestion performance. Thickening technologies were evaluated for the thickening of PS, waste activated sludge (WAS), and a combination of the two. Currently EWA operates sludge thickening at EWPCF using primary clarifier thickening for PS as well as a dissolved air flotation thickener (DAFT) process for WAS; details of these technologies are also included below.

#### 3.1.1 Primary Clarifier Thickening

In primary clarifier thickening, sludge settles by gravity in the primary clarifier and is pumped out to the digester feed system via a dedicated line. Historical use of this process shows an improvement in digester performance as compared to sending thin PS to digestion. EWA typically achieves 4.1 percent total solids (TS) in the PS using primary clarifier thickening. The process is easy to operate and is space-efficient, but does not achieve as high a TS content as some of the other processes detailed herein.

#### 3.1.2 Dissolved Air Flotation Thickening

As mentioned above, DAFT is the current process used to thicken WAS at EWPCF. The DAFT process works by forming air bubbles in a tank to which suspended solids attach. The adhered solids float to the surface, where they can be removed with the aid of a skimming device. Polymer is often added as a coagulant aid. DAFTs have the advantage of being relatively simple to operate, and EWPCF typically achieves 5.6 percent TS from its DAFT process. While currently used only for WAS, DAFTs can be used to co-thicken PS and WAS if desired; however, operating in this configuration may generate more odors.

### 3.1.3 Rotary-Drum Thickening

RDTs feed sludge into a rotating perforated drum with a screw to carry sludge to allow water to separate from sludge material while solids are conveyed to a discharge point for piping. A polymer is typically added upstream of the RDT to encourage large solids flocs. Figure 3-1 shows a typical RDT system.

Figure 3-1. Rotary-drum thickener.

Source: <a href="http://www.fkcscrewpress.com/crst.html">http://www.fkcscrewpress.com/crst.html</a>

Because of the enclosed system design, RDTs typically have low odor control requirements, require smaller footprint, are simple to operate, and have low capital and O&M costs as compared to other mechanical thickening equipment such as gravity belt thickeners and thickening centrifuges. The PMP evaluation noted that the O&M costs associated with RDTs are also lower than those associated with the existing thickening system. However, RDTs are also known to be sensitive to sludge feed concentrations and require a significant wash water demand.

### 3.2 Stabilization Technologies

Digestion is the core stabilization technology for the purpose of reducing pathogens, reducing vector attraction, and generally making a biosolids product capable of meeting regulatory requirements associated with beneficial use. Individual digestion technologies evaluated in this process are described below. As discussed previously, only anaerobic digestion technologies were considered in this evaluation.

### 3.2.1 Mesophilic Anaerobic Digestion

Mesophilic anaerobic digestion (MAD) is a conventional sludge stabilization process. MAD employs operating temperatures between 95 and 102 degrees Fahrenheit (°F) and solids are digested under anaerobic conditions. Typically, MAD systems are operated at a minimum hydraulic retention time (HRT) of 15 days, which, when requirements for vector attraction reduction (VAR) are met, guarantees Class B pathogen status for beneficial use. This stabilization process has the longest operational history of all the processes under consideration, with the most supporting operational data to date.

Although this alternative provides the major benefits of operational simplicity and a long history of operation, the process has its disadvantages when compared to newer, more aggressive technologies. While MAD operates efficiently, the degradation rates are relatively low when compared with other advanced digestion processes. This lower biological degradation rate manifests itself in terms of lower VS destruction, lower gas production, more tankage volume required, and additional mass of solids for disposal relative to the other processes evaluated. In addition, use of MAD allows for less available capacity for co-digestion substrates because of the inherently lower organic loading rate (OLR) associated with the process. As MAD is the current stabilization technology at EWPCF, it passed the fatal-flaw filter.

#### 3.2.2 Mesophilic High-Solids Digestion

A high-solids MAD or recuperative thickening is a process that thickens digested sludge (DS) from the digester and returns it back to the digester, increasing solids retention time (SRT) and returning anaerobic bacteria to the digester to increase biological activity. Thickening processes include centrifuges, gravity belt thickeners, and DAFT.

The major benefit of this process is the increase in SRT, which means that more capacity is available in the digester. This is often beneficial when a tank is taken out of service for maintenance, or may prolong construction of future additional digesters. However, this process can be complex to operate, requires process equipment in addition to process equipment for the digester system, and requires additional polymer. Industry experience with this process is fairly limited; current installations are on digesters of much smaller volume than those at EWPCF. The BC team recommended that this process pass the fatal flaw filter, but only for installation on the smaller digesters at EWPCF (which would need to be rehabilitated for such an installation). If EWA chose to implement such an alternative, it would enable them to gain experience in operating a high-solids digestion system prior to installing it on the large digesters.

### 3.2.3 Staged Mesophilic Anaerobic Digestion

In a conventional MAD system, digesters are operated in parallel. In staged MAD, the digesters are operated in series. The first stage consists of heating and mixing the feed sludge to sufficiently stabilize the influent sludge. In this first stage, an HRT of 7 to 10 days is used but a higher OLR may be selected to reduce the overall footprint. The second stage receives, heats, and mixes sludge from the first stage, but operates at a lower HRT because the bulk of digestion takes place in the first stage.

The advantage of this process is significantly reduced short circuiting, which in turn improves VS reduction (VSR) and final product stability. Thus, higher-quality biosolids are typical when compared against a single-staged mesophilic system operated at an equivalent detention time, although in both cases, Class B biosolids are produced. Finally, a minor increase in gas production may be observed with this process. Despite these advantages, this alternative requires a larger overall footprint than conventional MAD and may require additional heating as compared to the current system. Given the limited available digestion footprint at EWPCF, this technology did not pass the fatal-flaw filter.

#### 3.2.4 Acid-Gas Phase Digestion

Acid-gas phase digestion (also known as multi-phase or two-phase digestion) is a two-phase process in which two separate tanks are designed around different process goals, allowing the conditions in each tank to be optimized for the desired metabolic process. The first phase, the acid phase, is characterized by short HRT, typically 1 to 2 days, and low pH. Under these conditions, the acid-forming bacteria respire optimally, converting the particulate organics to volatile acids. The gas phase receives sludge from the acid phase, and has a longer HRT. The high level of volatile acids in the sludge supports a strong methanogen population.

As with conventional MAD, a total 15-day HRT is desirable in the acid-gas digestion process, and the sum of both the acid phase and the gas phase HRT are used to achieve this goal. However, most of the gasification of organics occurs in the second phase rather than the first. It is important to note that the acid phase sludges and gases are corrosive, and appropriate equipment and construction materials are required. Optimization of the fermentation stage is important for effective operation of acid-gas digestion. Gas from the acid phase includes carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and hydrogen sulfide (H<sub>2</sub>S), and is commonly connected to the digester gas system. If the gas phase is not connected to the gas system, extensive odor control may be required. Excessive retention times in the acid phase may increase odorous compounds, including H<sub>2</sub>S. These compounds may impact the operational life or performance of gas utilization equipment and may generate odors at the flares. In addition, acid-gas digestion can be very challenging to operate correctly, despite its apparent similarities to MAD. For these reasons, acid-gas digestion did not pass the fatal-flaw filter.

#### 3.2.5 Thermophilic Anaerobic Digestion

Thermophilic anaerobic digestion (TAD) is a means of enhancing digestion capacity at the facility through anaerobic digestion at thermophilic temperatures, ranging from 122 to 132°F. The high-temperature operation increases reaction rates and provides additional gas production, solids destruction, and increased pathogen inactivation. TAD can accommodate approximately double the OLR of MAD, up to 0.4-pound VS per cubic foot per day (lb-VS/ft³-d).

Thermophilic digestion can be configured to generate Class A biosolids. This can be accomplished with batch tanks, for example, where the sludge is held for 24 hours at thermophilic temperatures (131°F or greater) to meet EPA requirements for Class A. Some wastewater treatment facilities, like the City of Los Angeles, have produced Class A biosolids using thermophilic digestion with limited-size batch tanks, which results in somewhat less time and temperature stipulated by the Class A criteria; however, additional sampling and testing of the biosolids is required to demonstrate Class A compliance in such instances. TAD would easily integrate within EWPCF and, as a well-proven technology, it passed the fatal-flaw filter.

### 3.2.6 Temperature-Phased Anaerobic Digestion

A temperature-phased anaerobic digestion (TPAD) system operates in two distinct temperature phases, digesting sludge in different tanks arranged in series. The first phase is the thermophilic phase, which typically operates at an HRT between 5 and 10 days. This is followed by a mesophilic phase typically operated between 6 and 15 days HRT. If Class B biosolids are desired, the TPAD system would be designed such that the combined retention time meets the 15-day HRT requirement. As with the TAD system, the OLR is approximately double MAD, at 0.4 lb-VS/ft³-d, applied to the first-stage thermophilic digester. This high loading rate can allow for smaller digesters or fewer digesters to be constructed, reducing footprint relative to the overall system capacity, if the relevant criterion for total system HRT is met.

By phasing the digestion process through the thermophilic phase to the mesophilic phase, the advantages of thermophilic digestion are gained but carry an additional benefit of allowing the mesophilic phase to "polish" the volatile acid concentrations, improve VSR, and reduce odors. The thermophilic digestion process is typically characterized by high biogas production rates, high VS destruction (65 to 65 percent), and significantly enhanced pathogen kill. Essentially, most of the stabilization occurs in the thermophilic phase. In this phase because of the higher OLR and temperature, there are higher volatile acid and ammonia concentrations. When cooled and allowed to enter the mesophilic phase, these concentrations are polished, decreasing volatilized ammonia and other odorous compounds. Like TAD, TPAD can be configured to generate Class A biosolids. The footprint required for TPAD, however, cannot be accommodated within the available area of EWPCF, and therefore this technology did not pass the fatal-flaw filter.

#### 3.2.7 Thermal Hydrolysis Process

THP is an anaerobic digestion pretreatment system that results in more efficient wastewater solids processing and energy production and, in certain configurations, achieves Class A biosolids. The three types of THP systems presented and screened are Class A THP, Exelys digestion-lysis-digestion (DLD), and SolidStream™ Cambi.

#### 3.2.7.1 Class A THP

Class A THP is a mature technology in Europe and world-wide with full-scale facilities in service since 1995; the first installation in the United States (DC Water) has been operating since late 2014 and other U.S. installations are in the planning, design, and construction phases. There are two primary manufacturers of Class A THP – Cambi and Veolia. Class A THP uses medium-pressure steam to create high temperature and pressure conditions, which lyse bacterial cells and promote the release and solubilization of particulate organic material, making the feed solids more amenable to digestion. Figure 3-2 below depicts a typical process flow of the Cambi Class A THP system. THP can also be used in a WAS-only configuration, where it would generate Class B biosolids. This process will be discussed and evaluated in TM 4.

Figure 3-2. Cambi thermal hydrolysis process.

The vast majority of Class A THP systems have been implemented by Cambi. However, competitor THP systems have been installed in Europe, and Veolia's Biothelys system has been installed in the United Kingdom at a size comparable to EWPCF. THP systems can approximately double MAD OLRs because of the modified characteristic of the feedstocks. This more efficient use of digester volume reduces the number of digesters required. Ancillary buildings and equipment are required to operate a THP system, including steam boilers, pre-dewatering centrifuges, raw cake storage, and sludge cooling systems. While THP systems can reduce digester volume required, these ancillary systems impact total system cost, complexity, and footprint. Given that this technology is proven and can be integrated into the EWPCF foot-print, it passed the fatal-flaw filter.

#### 3.2.7.2 Exelys Digestion-Lysis-Digestion

Exelys-DLD is a process developed by Veolia. While many THP systems use a batch process, Exelys uses a continuous flow reactor. In the DLD configuration, hydrolysis does not occur on the digester feed. Hydrolysis is placed between two digestion steps instead of prior to digestion, as shown in Figure 3-3. This configuration helps digestion by hydrolyzing solids that are resistant to digestion. The readily digested material has already been digested in the first digestion stage, leaving only the harder-to-digest organics. This material is now more digestible in the second-stage digester. Relative to MAD, this system would produce more biogas and destroy more solids. The process requires more digestion tankage than more common THP approaches and this makes it infeasible for EWA. In addition, Exelys-DLD does not have full-scale installations in North America. This technology thus failed the fatal-flaw filter.

Figure 3-3. Exelys digestion-lysis-digestion process.

Source: Veoliawatertech.com

#### 3.2.7.3 SolidStream Cambi

SolidStream Cambi is different from Cambi's traditional Class A THP in that it does not hydrolyze the solids prior to digestion. The sludge is digested in a digester, such as MAD, and then the DS is dewatered. Dewatered sludge enters the SolidStream system where it is hydrolyzed and final dewatered as a hot material. In this process, the dewaterability of the sludge is increased by increasing the temperature and pressure. This degrades the extracellular polymeric substances, which causes the release of more water from the sludge. Immediately following hydrolyzing, the solids are dewatered using a centrifuge without the addition of polymer. The centrate is fed to the digester and cake can be a Class A material. Figure 3-4 provides an overview of this process. The benefit of SolidStream Cambi is the increased dewaterability of the solids and the additional soluble COD from the centrate can increase gas production. This technology has yet to be installed in North America and it has not been demonstrated on the scale of EWPCF. Therefore, this technology failed the fatal-flaw filter.

Figure 3-4. SolidStream Cambi process.

Source: <a href="http://www.cambi.com/Products/Cambi-SolidStream">http://www.cambi.com/Products/Cambi-SolidStream</a>

### 3.2.8 Enzymatic Hydrolysis

Enzymatic hydrolysis is a stabilization method that enhances enzyme activity of the anaerobic bacteria by using six serial reactor vessels. The initial enzymatic hydrolysis process tanks operate between 95°F and 108°F with short detention times (e.g., 3 days) to promote acidogenic bacterial growth. The subsequent process tanks can operate at upwards of 95°F, which promotes the growth of methanogens.

The company Monsal (<a href="www.monsal.com">www.monsal.com</a>) is the major technology provider in Europe with about 11 reference installations in the United Kingdom. Monsal claims that its high-rate hydrolysis technology and equipment can be retrofitted to existing digestion plants for upgrade or developed as part of new build turnkey digestion plants. Claimed key benefits of Monsal advanced digestion technology include: (1) high digester loading greater than 0.19 to 0.38 lb-VS/ft³-d; (2) improved solids dewatering—up to 30 percent DS; and (3) high biogas yields. This technology has not been installed full-scale in North America, and it thus failed the fatal-flaw filter.

### 3.2.9 Thermo-Chemical Hydrolysis

The thermo-chemical hydrolysis process uses chemicals and elevated temperature to expedite the hydrolysis step. The major technology provider is CNP Technologies and its Pondus TCHP process. CNP currently operates a full-scale pilot operation at the Kenosha WWTP in Kenosha, Wisconsin.

TCHP is designed to focus on TWAS pretreatment. In this process, TWAS is mixed with caustic soda (1,500 to 2,000 parts per million [ppm]) to reach a pH of approximately 11. TWAS is then heated to thermophilic temperatures (150°F to 160°F), using heat exchangers prior to being fed to the reactor. Detention time of the reactor is between 2.0 and 2.5 hours, during which the hydrolysis breaks down the cell walls and releases internal organic acids. The hydrolyzed sludge is then sent to the digesters for digestion. The Pondus TCHP has seen reported benefits of higher VSR, biogas production, and dewaterability of cake. The nature of the chemical storage and the addition of a new reactor in proximity to digestion was believed to be an incompatibility with the EWPCF site, and this technology thus failed the fatal-flaw filter.

### 3.2.10Lystek

Lystek is a Canadian company with several full-scale installations in Canada and one full-scale installation in the United States. Lystek uses a process that thermally hydrolyzes the solids after digestion and dewatering. This process can be performed on digested or raw sludge. The result is a Class A fertilizer product. Additionally, Lystek claims that the solid material after it has undergone its process can be fed back into the digester to provide more biogas production and higher VSR. It can also be used as a carbon source for biological nutrient removal. Lystek opened its first U.S. installation in Fairfield, California, in 2016. This is a regional facility treating solids from several Bay area treatment plants, roughly equivalent to the solids production from a 150 mgd treatment plant. There are concerns whether the product meets vector attraction reduction requirements. As a proven process that could be accommodated within EWPCF's footprint, Lystek passed the fatal-flaw filter.

### 3.2.11Summary of Fatal-Flaw Evaluation

Table 3-2 displays the results of the fatal-flaw analysis for stabilization technologies. Passing the fatal-flaw filter are MAD, high solids mesophilic digestion, thermophilic digestion, Class A THP, and Lystek as presented and discussed during Workshop 2. All the stabilization technologies selected have a sound technological basis and could theoretically be integrated into the site given sufficient footprint; thus, none of the technologies failed the compatibility criterion. Technologies that failed fatal-flaw criteria did so as follows:

- Technology maturity: Enzymatic hydrolysis, Exelys-DLD, and SolidStream Cambi do not have full-scale installations in North America and thus failed on this criterion.
- Successful operation of comparable size: Enzymatic hydrolysis, Exelys-DLD, and SolidStream Cambi have been proved at demonstration scale only outside of North America.
- Available space: Preliminary calculations were performed to assess the ability to incorporate staged digestion processes such as acid-gas, TPAD, staged MAD, or Exelys-DLD. These calculations are provided for reference in Attachment C. The results indicated that the site cannot accommodate any of the staged digestion processes within the existing digestion area footprint and tankage.

<sup>&</sup>lt;sup>1</sup> Passes fatal flaw filter for inclusion on small digesters at EWPCF only.

### 3.3 Dewatering Technologies

This section presents dewatering technologies the BC team looked at as part of this evaluation. EWA has utilized both centrifuges and belt filter presses (BFPs) for dewatering; the team expanded the evaluation to newer technologies as well.

### 3.3.1 Centrifuge

Centrifuge dewatering is a well-known technology in the wastewater industry. It uses centrifugal force to push solids to the outside of the conveyor for collection and allow water to separate and collect in the center for discharge. Polymer may also be added to increase solids accumulation and separation. The downside of centrifuges is their higher energy demand. Centrifuges are the current dewatering technology employed at EWPCF and passed the fatal-flaw filter.

#### 3.3.2 Belt Filter Press

Another common dewatering technology, BFPs have been in the wastewater industry for decades. BFPs apply mechanical pressure to sludge by pressing two belts together. They use cloth and rollers to remove water from sludge. The machine is basically divided into three zones: (1) gravity, where free-draining water is removed, (2) wedge zone, where sludge is prepared for high-pressure application, and (3) pressure, where high pressure is applied between belts to remove water. Typically, a BFP can achieve solids content of 12 to 35 percent, depending largely on feed characteristics. Maintenance is relative simple; however, odors may be a problem. While BFPs have been used previously at EWPCF, they could not be accommodated in the current dewatering area and would need to be located elsewhere, potentially at the exclusion of other improvements. This aspect of siting will be addressed in the construction of alternatives and will be described in TM 7. BFPs pass the fatal-flaw filter.

#### 3.3.3 Screw Press

Screw presses are a relatively new technology compared to centrifuges and BFP. However, there are many installations in North America. A screw press is a conical screw shaft surrounded by cylindrical sieves. As the screw rotates, the sludge slowly moves along the shaft and water is pressed out through the sieves. Screw press manufacturers claim that this technology offers less maintenance, lower wash water consumption, and lower energy consumption. This proven technology could be integrated into the EWPCF footprint; although, as noted with belt presses, they could not be accommodated in the current dewatering area and

would need to be located elsewhere, potentially at the exclusion of other improvements. Screw presses passed the fatal-flaw filter.

#### 3.3.4 Rotary Press

Rotary press is a simple technology. Sludge enters the channel and rotates between two filtering elements. The water passes through these filters as the sludge continues to travel along the channel. The dewatered sludge collects at the exit of the channel where it is extruded as cake. Manufacturers claim that rotary presses have few mechanical parts, reducing maintenance. This proven technology could be integrated into the EWPCF footprint, although, as noted with belt presses, they could not be accommodated in the current dewatering area and would need to be located elsewhere, potentially at the exclusion of other improvements. Rotary presses passed the fatal-flaw filter.

#### 3.3.5 Volute Press

A volute press is similar to a screw press. However, instead of using a shafted screw, it contains main discs stacked together horizontally. As the sludge moves along the discs, water is pressed between the discs. The volute press is found primarily in industrial applications, but there are a few municipal installations in North America. This is, however, a proven technology that could be integrated into the EWPCF footprint; although, as noted with belt presses, they could not be accommodated in the current dewatering area and would need to be located elsewhere, potentially at the exclusion of other improvements. Volute presses passed the fatalflaw filter.

#### 3.3.6 Bucher Press

The Bucher press has installations worldwide including one installation in Victoriaville, Quebec. This installation dewaters excess sludge and dairy waste and is at a comparable capacity as EWPCF. However, it is not a domestic wastewater treatment facility, thus, the Bucher press failed the fatal flaw filter. The Bucher press operates in cycles, lasting 70 to 120 minutes. The cylinder, which contains filter cloth (filter sleeves), is filled with sludge. A press piston is moved forward, forcing the liquid through the filter cloth. The press piston expands, allowing the sludge to loosen and the process is repeated until the desired solids content has been achieved.

#### 3.3.7 Summary of Fatal-Flaw Evaluation

Table 3-3 displays the results of the fatal-flaw analysis for dewatering technologies. In this category, all but the Bucher press passed the fatal-flaw filter. While there are installations of the Bucher press in Canada and Europe, there are no known municipal sludge installations in North America. Also, the complexity of operation and additional cost was felt to be incompatible with an installation at EWPCF.

Table 3-3. Dewatering Technologies Fatal-Flaw Results				
Technology	Technology Maturity	Successful Operation	Available Space	Compatibility
Centrifuge	Pass	Pass	Pass	Pass
BFP	Pass	Pass	Pass	Pass

### 3.4 Post-Dewatering Technologies

Post-dewatering technologies allow for further processing and the creation of new biosolids products. The existing technology—direct drum drying—is discussed along with other potential process train additions.

### 3.4.1 Direct Drum Drying

A drum dryer is a direct drying process that mixes heated air with biosolids in a triple-pass rotary system. The heated air comes in contact with the biosolids in the rotating drum, evaporates water from the biosolids, and produces a granule. Drying begins when dewatered sludge is mixed with the recycled solids to control the moisture content of the mixture and minimize sticking to the inner surface of the drum and to allow the wetter sludge to absorb the finer solids coming from the crusher. Air heated to between 850°F and 950°F is introduced in the drum while the sludge mixture tumbles through and exits the other end. From the dryer, the dried solids are fed to a separator to separate the hot air from the solids. The solids are then screened; particles of the appropriate size are conveyed to storage silos while other solids are sent to the crusher. The crushed biosolids are blended with fresh dewatered sludge as described previously. Air emission and odor control systems consist of polycyclones, impingement trays, condensers/sub-coolers, venturi scrubbers, and regenerative thermal oxidizers (RTOs) for the process of off-gas emission control. Up to 75 percent of exhaust gas recirculation is applied to increase the efficiency of the drying system and reduce total dryer system air emissions and odor potential. This existing post-dewatering technology on site at EWPCF passed the fatal-flaw filter.

### 3.4.2 Indirect Drying

Indirect drying systems use convection heat transfer processes as opposed to conduction heat transfer used in direct dryers. Conduction systems are often called "indirect" dryers because the biosolids do not come in direct contact with the heat medium. A conduction system has significantly less exhaust air to treat than a convection system and typically has a smaller footprint than a similarly sized convection system. But conduction systems such as paddle or vertical tray dryers typically produce an irregular shaped product with a relatively high concentration of fines, although some can produce more uniform granules with reasonably low dust concentrations. Convection systems can operate in the 300°F to 1,000°F range, depending on the specific dryer.

There are a number of manufacturers of indirect dryers. While some indirect drying technologies can produce Class A biosolids, they yield a product with different characteristics from the drum dryer. The complexity of operating two different drying technologies and managing two different products was believed to be an incompatibility with the EWPCF site, and indirect drying thus failed the fatal-flaw filter.

#### 3.4.3 Solar Drying

Solar drying uses radiant and convective heat transfer methods in a greenhouse system to dry the solids. The greenhouse system is typically constructed with multiple large bays that allow for isolating a bay once it is fully loaded. Dewatered solids are spread in thin layers inside a drying chamber. A microprocessor controls vents and fans to optimize the humidity level within the chamber to promote drying. A small automatic mobile mixer agitates the solids on the bed to promote drying. Solar drying is typically used to dry to between 40 and 90 percent TS. Higher TS concentrations require more time in the drying chamber. Demonstrating compliance of solar drying with Class A criteria may require testing of each batch of material. The primary advantage of solar drying is the low energy needed to create a partially dried biosolids product. The primary disadvantage of solar drying is that it requires significant site space; in the case of EWPCF, it requires a greater footprint than that available and it thus failed the fatal-flaw filter.

#### 3.4.4 Gasification

Gasification is a partial oxidation process, where sub-stoichiometric quantities of air (oxygen) are injected with biosolids into a gasifier to allow partial combustion of carbon to  $CO_2$ , which then reacts with carbon to produce carbon monoxide (CO). The gasification process takes place at temperatures ranging from 1,472°F to 1,832°F. The gaseous products from biosolids gasification are CO, hydrogen, and  $CH_4$  with trace amounts of nitrogen,  $CO_2$ , and  $H_2S$ . The product gases (called syngas) can be combusted directly after removal of particulates and acid gases, or further purified to a higher value (greater thermal energy) gas. The process generates a solid residue (char) that can be used for a variety of applications such as for making asphalt or as filler material in building and landscaping.

Gasification of biosolids is considered to be an emerging technology in the United States, with no operating full-scale facilities at this time. It is a complex process that requires drying of the biosolids prior to gasification. There have been numerous pilot studies, and one full-scale system constructed, but that facility was closed for financial reasons during an extended startup phase that encountered numerous difficulties processing the solids. One supplier of gasification systems has recently developed a wood waste gasifier in Tennessee and is processing relatively small quantities of biosolids with the wood waste. As an emerging technology, gasification failed the fatal-flaw filter.

#### 3.4.5 Pyrolysis

Pyrolysis is a thermochemical conversion process that is performed in the absence of oxygen. Like gasification, pyrolysis systems tested to date with biosolids require drying of the solids to 90 percent TS prior to being introduced into the pyrolysis unit. The process converts the biosolids to biochar and syngas. Pyrolysis occurs at temperatures of approximately 1,000°F. The syngas is a low-grade energy source with a heat value of approximately 500 Btu per standard cubic foot and is composed of a mixture of CH<sub>4</sub>, CO<sub>2</sub>, and hydrogen, with other contaminants. The biochar can be sold as a slow-release fertilizer.

Like gasification, pyrolysis is considered to be in its infancy. One system supplier, KORE Infrastructure, conducted a 6-year pilot test at Los Angeles County Sanitation District that concluded in 2015. KORE is planning for a full-scale system in San Bernardino County with a capacity of reportedly 150 dry tons per day (dtpd). As an emerging technology, pyrolysis failed the fatal-flaw filter.

#### 3.4.6 Incineration

Incineration of dewatered solids achieves the greatest reduction in volume and mass for subsequent reuse or disposal by eliminating the water content of the solids and oxidizing the organic material in the sludge. The resulting sterile ash consists of the inert portion of the dry solids. The overall reduction is greater than 90 percent of wet solids feed. While there are opportunities for beneficial use of the ash, it is typically sent to landfill for disposal.

Incineration is particularly suited for plants with limited space, large solids generation, no anaerobic digestion, and continuous, controlled operation despite weather conditions. The primary concern with incineration is public perception that an incinerator produces harmful air emissions. These perceptions combined with regulatory requirements can result in a need for additional time for planning to obtain an air emissions permit. Complex and advanced air emissions control equipment is required to meet regulation. Because of the public perceptions, stringent regulatory requirements, and heavy onus on the owner to prove environ-mental compliance of this technology, new incineration facilities have not been developed in the United States in decades. In California, only two active incinerators exist at WWTPs, and the incinerator used by the Palo Alto Regional Water Pollution Control Facility will be shut down within the next 5 years. Plans for a new incinerator in Southern California, proposed by Liberty Energy, were sidelined by public opposition and

challenges in gaining permit approvals. The likelihood of getting a new incinerator permitted in a timely fashion was believed to be an incompatibility and it thus failed the fatal-flaw filter.

#### 3.4.7 Deep-Well Injection

Deep-well injection for biosolids is a proprietary technology of GeoEnvironment Technologies (GET), which was recently acquired by Advantek Waste Management Services (Advantek), located in Houston. Using this process, undigested sludge would be thickened and then pumped to an injection facility, consisting of a screening system, mixing tank, and high-pressure injection pumps. The high-pressure injection pumps would convey thickened sludge at around 2.5 percent TS content through deep injection wells to an underground suitable geologic formation deeper than 5,000 feet. In the underground formation biosolids would undergo anaerobic digestion, with stabilization of solids and production of CO<sub>2</sub> and CH<sub>4</sub>.

The first full-scale demonstration of deep-well injection of biosolids was developed for the City of Los Angeles at the Terminal Island WWTP. The project, referred to as the Terminal Island Renewable Energy (TIRE) project, began operation in 2008 and was scheduled to be a 5-year demonstration project, but has operated for the past 8 years. The process accommodates approximately 13 percent of the City's biosolids production. The success of this technology is geologically specific, and Advantek has been challenged to find other suitable locations, thus causing this technology to fail the fatal-flaw filter.

#### 3.4.8 Dehydration

Dehydration is another term for thermal drying of biosolids. This technology has been used mainly for food waste. Recently, it has been proposed to use with dewatered biosolids. This may be feasible, but experience has shown that it can take years for manufacturers of drying systems used for various materials to learn how to apply the technology for drying biosolids. The difficulties of providing a homogenous source to the dryer and the physical characteristics of the sludge can make thermal drying difficult. As an emerging technology, dehydration failed the fatal-flaw filter.

#### 3.4.9 Fatal-Flaw Evaluation

Table 3-4 contains the results of the fatal-flaw analysis for post-dewatering. The current technology in use, a drum dryer, passed the fatal-flaw filter. The other technologies evaluated failed in all but the available space category, as follows:

- Technology maturity: While biosolids-to-energy technologies have advanced in the past decade, there has yet to be a full-scale installation of pyrolysis or gasification at a municipal WWTP.
- Successful operation: Gasification and pyrolysis pilot and demonstration units have been installed at WWTPs but none of these have been of a size comparable to what would be required for EWPCF.
- Compatibility: While indirect dryers are a well-established technology, EWA already has a direct dryer installed. The difficulty of operating two separate drying technologies and managing two separate dried products presents a fundamental incompatibility with EWA's operations.

Table 3-4. Post-Dewatering Fatal-Flaw Results				
Technology	Technology Maturity	Successful Operation	Available Space	Compatibility
Thermal drying: high-quality (drum dryer)	Pass	Pass	Pass	Pass
Thermal drying: low-quality (indirect dryer)	Pass	Pass	Pass	Fail
Partial solar drying	Pass	Pass	Fail	Fail
Gasification	Fail	Fail	Pass	Pass
Pyrolysis	Fail	Fail	Pass	Pass
Incineration	Pass	Pass	Pass	Fail
Deep-well injection	Pass	Pass	Pass	Fail
Dehydration	Fail	Fail	Pass	Pass

### **Section 4: Ranking of Screened Technologies**

This section describes the results of applying the evaluation criteria described in Section 2.3 to further screen and rank the technologies that passed the fatal-flaw filter.

### 4.1 Evaluation Approach

Following application of the fatal-flaw filter, Table 4-1 summarizes the technologies that were further evaluated using established criteria. The final scores and weightings were fixed in Workshop 2 with EWA staff. Thickening and post-dewatering technologies were not evaluated in this step, as there was no need to further screen these; the technologies listed in Table 4-1 will be carried forward for inclusion in end-to-end alternatives.

Table 4-1. Summary of Screening Technologies					
Thickening Technologies	Stabilization Technologies	Dewatering Technologies	Post-Dewatering Technologies		
Primary clarifier	Mesophilic digestion	Centrifuge	Drum dryer		
Dissolved air flotation	Mesophilic high-solids digestion	Belt filter press			
Rotary drum thickener	Thermophilic digestion	Screw press			
	Class A THP	Rotary Press			
	Lystek	Volute Press			

#### 4.2 Results and Discussion

In this analysis, a weighted average score of 3 or less led a technology to be eliminated from further consideration. The rationale behind the scoring for each technology area is described below and agreed to during Workshop 2.

#### 4.2.1 Thickening

The thickening technologies were not screened further as EWA expressed during Workshop 2 that they wanted all three thickening options listed in Table 4-1 evaluated.

#### 4.2.2 Stabilization

Table 4-2 displays the scoring results for the stabilization technologies that passed the fatal-flaw filter. Among these, thermophilic digestion scored the highest, followed by mesophilic digestion and Class A THP. The rationale behind individual criterion scores is discussed below.

Table 4-2. Stabilization Technology Results						
Criterion	Mesophilic Diges- tion	Mesophilic Digestion with High Solids	Thermophilic Diges- tion	Class A THP	Lystek	
End-use market compatibility	3	3	3	5	2	
Proven technology performance	5	2	5	4	2	
Minimize life-cycle costs	3	3	4	2	2	
Energy/resource recovery	3	4	5	4	3	

Table 4-2. Stabilization Technology Results						
Criterion	Mesophilic Diges- tion	Mesophilic Digestion with High Solids	Thermophilic Diges- tion	Class A THP	Lystek	
0&M impacts	4	3	4	3	3	
Environmental impacts	4	4	4	4	3	
Community and stakeholder impacts	4	4	4	4	2	
Project site compatibility	5	3	5	2	4	
Total Score	3.80	3.25	4.20	3.65	2.50	

With respect to end-use market compatibility, mesophilic digestion, mesophilic digestion with high solids, and thermophilic digestion all yield a dewatered cake with similar properties. Assuming a Class B cake, this product can be beneficially used in agriculture in Arizona or sent to regional compost facilities for further processing—both end uses are widely employed by other Southern California agencies. Thus, these three technologies received a score of 3 for this criterion. Class A THP produces a low-odor, more granular Class A cake, the aesthetic properties of which make it more acceptable to end users, thus, yielding a higher score. Lystek produces a Class A liquid fertilizer that would be more logistically challenging and expensive to haul the long distances typically required to access sufficient agricultural acreage. In addition, the product is untested in the Southern California region and is questionable in meeting regulatory requirement for vector attraction reduction, resulting in a lower score than the digestion technologies.

For the criterion of proven technology performance, mesophilic digestion and thermophilic digestion are both well proven with long performance records at WWTPs of various sizes. While not as well established as these digestion technologies, Class A THP (primarily Cambi) has nearly 50 worldwide installations, mainly in Europe, with a 20-year performance record. This resulted in a maximum score of 5 for mesophilic and thermophilic digestion and a score of 4 for Class A THP. Lystek has only one U.S. installation of its technology, causing it to receive a score of 2. Additionally, mesophilic digestion with high solids receives a score of 2 because it a less proven technology with only one case study in the U.S. However, there are several full-scale installations using similar non-propriety technology.

Mesophilic digestion and mesophilic digestion with high solids received a score of 3 for minimizing life-cycle costs. Thermophilic digestion allows for greater importation of high-strength waste, a revenue source, and was thus assigned a slightly higher score of 4. Lystek and Class A THP both involve additional processes that have their own personnel and energy demands, resulting in a lower score of 2.

Biogas production, the ability to import high-strength waste, ability to beneficially use biosolids, and net energy demand all influenced the score for the "energy/resource recovery" criterion. Thermophilic digestion offers a greater ability to import high-strength waste. Thermophilic digestion has a higher VSR, which corresponds to a greater gas yield. Conservatively, the energy required to heat a thermophilic digester can be assumed to be equivalent to the gain in VSR, an assumption that will be refined during the alternatives analysis. Improved proportional gas yield and the ability to take in more high strength waste resulted in thermophilic digestion receiving the highest score. Class A THP allows for greater biogas generation but also has somewhat higher energy demands. While Class A THP likely has the highest energy demand of the technologies listed, it also yields a favorable biosolids product, as discussed above. Class A THP received a score of 4. Similarly, mesophilic digestion with high solids received a score of 4 due to increased capacity. Mesophilic digestion once again performs somewhere in the middle, with a score of 3. Lystek uses mesophilic digestion at its core, and while a version of the process can boost biogas production, it also

requires importation of chemicals, additional trucks to haul the material to beneficial-use sites, and a slightly larger energy demand than either mesophilic or thermophilic digestion.

With respect to 0&M impacts, most of the technologies scored similarly. Mesophilic digestion scored a 4, one point higher than the other technologies, because it reflects a technology that is well established and understood by EWPCF staff.

Most of the technologies are fairly benign from an environmental standpoint and received a score of 4 under the "environmental impacts" criterion. Lystek received a score of 3 because of the need to import chemicals and the generation of additional truck traffic because of the liquid nature of the product. The addition of truck traffic, a sensitive issue in the community around EWPCF, also caused Lystek to be scored lower on the "community and stakeholder impacts" criterion. The other technologies were believed to perform similarly from this standpoint and received a score of 4.

Ability to integrate into the site with respect to both footprint and treatment process compatibility created differentiation among the technologies for the "project site compatibility" criterion. As the established technology at EWPCF, mesophilic digestion received the highest score, a 5. Thermophilic digestion would not significantly change the operation or footprint at EWPCF and thus received the same score. Mesophilic digestion with high solids and Lystek requires additional footprint and a change to the existing operational scheme, causing it to score lower. Class A THP requires operation of a steam plant, additional footprint, and integration of a novel process to the WWTP. As a result, it received the lowest score.

The weighted scores result in thermophilic digestion ranking first, followed by mesophilic digestion, Class A THP, mesophilic digestion with high solids, and Lystek. Based on the final scores, Lystek was eliminated from further consideration. Mesophilic digestion, mesophilic digestion with high solids, thermophilic digestion, and Class A THP will all be included in end-to-end alternatives evaluated under Task 7.

#### 4.2.3 Dewatering

Table 4-3 displays the results of the evaluation for the dewatering technologies. For three of the criteria—life-cycle costs, environmental impacts, and community and stakeholder impacts—the technologies were scored similarly. The more limited performance record of the screw press, rotary press, and volute press caused these technologies to be scored lower from a life-cycle cost standpoint. The open-air nature of a BFP requires additional odor control, which is rated by the lower score for environmental impacts.

Table 4-3. Dewatering Technology Results						
Criterion	Centrifuge	BFP	Screw Press	Rotary Press	Volute Press	
End-use market compatibility	3	5	4	3	3	
Proven technology performance	5	5	3	2	2	
Minimize life-cycle costs	4	3	3	3	3	
0&M impacts	5	4	3	2	2	
Environmental impacts	3	2	3	3	3	
Community and stakeholder impacts	4	4	4	4	4	
Project site compatibility	5	4	2	3	3	
Total Score	4.35	4.10	3.05	2.65	2.65	

Differentiating criteria in this technology category included end-use market compatibility, proven technology performance, O&M impacts, and project site compatibility. With respect to end use, a body of research

suggests that dewatering processes employing high-shear processes, such as centrifugation, yield cake with higher odors. Low-shear processes, like BFPs and screw presses, received higher scores than the other technologies. The limited experience with the products from rotary and volute presses also caused these technologies to be scored lower for end-use compatibility.

With respect to proven technology performance, centrifuges and BFPs are the most widely used dewatering technologies in the United States and thus received the highest possible score. Screw presses have been installed at several WWTPs over the past decade, but the performance record of these, including some in California, is mixed, resulting in a lower score. The lowest score, 2, was assigned to rotary and volute presses, whose track record is much more limited. Scoring fell along much the same lines for O&M impacts—both centrifuges and BFPs have been successfully used at EWPCF and operations staff are comfortable operating either one. The other technologies would represent a shift in process.

Centrifuges received the highest score for project site compatibility, as this is the dewatering technology currently employed by EWA. BFPs were used previously for dewatering, but were located in a different process area. As noted earlier, reconfiguration of the plant layout would be necessary to accommodate a change back to this technology. Screw presses require the largest footprint of any of the technologies and, like belt presses, would need to be located elsewhere.

Based on the weighted scores, BFPs scored the highest, followed by centrifuges, screw presses, rotary presses, and volute presses. The latter two scored below a 3 and were thus eliminated from further consideration.

#### 4.2.4 Post-Dewatering

As previously mentioned, all of the post-dewatering technologies failed the fatal flaw filter, except drum drying. Therefore, the drum dryer will be the only option carried forward for further evaluation.

### **Section 5: Implementation Considerations**

The BC team further evaluated the best-ranked technologies by presenting implementation considerations in a workshop with EWA staff held on September 19, 2017. Preliminary feedback on site layouts, process integration, and construction sequencing was considered for incorporation into the future alternatives analysis.

### 5.1 Thickening and Stabilization

The PMP established a location for the RDT units, shown in Figure 5-1. Thickening improvements can help make the digestion process more efficient and will create more hydraulic capacity by removing water from the sludge. With respect to the stabilization processes, several figures were developed to demonstrate potential siting considerations and construction sequencing. These are presented as Figures 5-1 through 5-3 and are discussed further below.

Figure 5-1. Preliminary layout for thermophilic digestion with a second dryer and expanded facilities for high strength waste receiving.

Mesophilic digestion is the current stabilization process. Preliminary calculations indicate that the existing tankage is insufficient to accommodate future flows and loads, particularly if there is a desire to import greater quantities of high-strength waste. If mesophilic digestion were to be maintained, the smaller, 300,000-gallon digesters (digesters 1, 2, and 3) would need to be rehabilitated and brought on line.

Thermophilic digestion occupies essentially the same footprint as mesophilic digestion. More heat exchanger capacity would need to be brought on line; this could be accomplished by replacing the existing units with taller, higher-capacity units. For the alternatives analysis, two thermophilic scenarios will be explored. The first is a 15-day HRT scenario, which guarantees Class B quality, but is limited by the ability to receive high-strength waste based on hydraulic capacity. A second scenario is a 10-day thermophilic process. Digestion remains stable at a 10-day HRT and EBMUD and others have successfully operated this process for years. This scenario allows EWA to receive greater quantities of high-strength waste, and a new receiving station could be constructed where some of the smaller digesters are currently located (Figure 5-1). Co-digestion capacity in these scenarios will be analyzed and described further in TM 4.

Implementation of THP (Figures 5-2 and 5-3) is somewhat more complicated, as creating space for the THP units requires demolition of existing process units. Figure 5-2 shows a layout in which the smaller digesters are demolished in favor of the THP units and the high strength waste receiving area shown in Figure 5-1 has been moved in closer proximity to the dryer building. A second layout developed requires demolition of the existing DAFTs to accommodate the THP units. In this scenario, shown in Figure 5-3, thickening upgrades would need to be performed prior to installation of the THP units.

Figure 5-2. Preliminary layout for THP where the smaller digesters are demolished for the THP units.

Figure 5-3. Preliminary layout for THP where the DAFs are demolished for the THP units.

### 5.2 Thermal Drying

One of the major questions to be addressed by the BEE is whether a second thermal dryer is necessary to meet EWA's goals. The existing building is space-constrained and a building modification may need to be constructed to accommodate a second dryer. Discussions on such modifications are currently underway and appropriate costs will be incorporated into the alternatives evaluation. In the event a new building is deemed necessary, the BC team prepared preliminary layouts for the second dryer that require demolition of the existing DAFTs. Under this scenario, thickening changes may need to be performed prior to the installation of the second dryer.

### **Section 6: Conclusions and Next Steps**

Screening of biosolids technologies resulted in a final selection of technologies to be included in end-to-end alternatives. The technology combinations are represented in Figure 6-1 and will be combined with the results of Tasks 3, 4, and 5 for the creation of end-to-end alternatives for analysis in the SWEET model. The three stabilization alternatives—mesophilic digestion, thermophilic digestion, and Class A THP—will each be evaluated both with and without the second drying train necessary to accommodate future growth. Development of end-to-end alternatives will be performed in cooperation with EWA staff prior to analysis.

Figure 6-1. Biosolids treatment technology options for EWCPF end-to-end project alternatives.

### Meeting Minutes

9665 Chesapeake Drive, Suite 201 San Diego, CA 92123

T: 858.571.8822 F: 858.571.8833

**Prepared for:** Encina Wastewater Authority

Project Title: Energy & Emissions Strategic Plan & Biosolids Management Plan Update

**Project No.:** 150871

Purpose of Meeting: Workshop #2 Date: August 16, 2017

Meeting Location: Encina Wastewater Authority Time: 1:30 – 5:00 PM

Minutes Prepared by: Hari Seshan and Jocelyn Lu, Brown and Caldwell

Attendees: Doug Campbell, Encina, JPA Adam Ross, Brown and Caldwell

Scott McClelland, Encina JPA

Jimmy Kearns, Encina JPA

Mike Steinlicht, Encina JPA

Octavio Navarrete, Encina JPA

Natalie Sierra, Brown and Caldwell

Scott Lacy, Brown and Caldwell

Nathan Chase, RMC

Tom Chapman, Brown and Caldwell

#### Attachments:

Workshop #2 Presentation Slides

#### **Decisions**

The following is a list of decisions made as a result of the meeting discussion:

- BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.
- Stabilization technologies that moved to the next round of evaluation: Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.
- Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Presses.
- Post-dewatering technology that moved to the next round of evaluation: Thermal Drying High Quality (Drum Dryer).
- Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines with Gas Conditioning, Internal Combustion Engines with Exhaust Treatment, Digester Upgrading Pipeline Injection, Micro-Turbines, Biosolids Drying Direct Use of Biogas, Large Scale Photovoltaics (PV), Small Scale Rooftop PV.
- Waste heat technologies that moved to the next round of evaluation: Small-Scale Steam Turbines, and Thermo/THP.

#### **Action Required**

The following is a list of actions required as a result of the meeting discussion:

- Jimmy to send Adam maintenance schedule costs.
- Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.
- Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments.
- Octavio to send EWA's SDG&E point of contact to Adam. EWA and BC to discuss initial contact with SDG&E regarding biomethane pipeline injection.
- Octavio to send Hari lab data on the performance of the centrifuges.
- Tom to work with Octavio on refining the solids mass balance.
- Adam to present a big picture view of the power production alternatives at the next workshop.
- BC to identify technologies that would be beneficial to visit at WEFTEC.
- BC will set up a meeting with Anaergia to discuss project goals and opportunities. This meeting will be separate from the Waste Hauler meeting.
- Scott L and Scott M will schedule Workshop 3 for mid-September aim for conducting the Waste Hauler meeting on the same day.
- EWA will take the dryer out of service in September/October. BC requests that any condition assessment results be shared with the team particularly related to the increased use of digester gas (siloxane or hydrogen sulfide issues).
- BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

#### **Summary**

Workshop #2 was held for the Encina Water Authority (EWA) Energy & Emissions Strategic Plan & Biosolids Management Plan Update. The purpose of this Workshop was to review pending administrative tasks and provide task updates. A summary of the discussion is provided below:

#### Introductory Items

BC started off the meeting by reviewing the schedule and goals for the meeting. The goals are to generate content and direction for the project team moving forward.

- This month, the Brown and Caldwell (BC) team will be:
  - Preparing a baseline report, to be reviewed by EWA in September.
  - o BC will also be preparing report sections of Tasks 2 and 3 by September.
  - In October and November, BC will be developing SWEET alternatives and providing more clarity on how the pieces interact.
- Adam Ross (Adam) stated that he expects to have more questions about permitting, cogeneration (cogen), electrical rates, and where to send digester gas, and would appreciate dialogue between now and the next workshop. EWA staff recommended for him to work with Octavio Navarrete (Octavio).

#### **New Data Request Items**

BC reviewed new data request items with EWA. They included:

• Trussell food waste capacity report - Scott McClelland (Scott M) stated that he has the data, but not the report, on the Trussell study. Preliminary conclusions of the report indicate that EWA could accept an additional 80,000 gal/week of FOG and 25,000 gal/week of brewery waste. EWA expect it'll take about another month before the report is ready. Imported wastes are received Monday – Friday/Saturday. A constant feed to the digesters is provided until around Saturday afternoon. A potential limitation to high strength waste acceptance is truck offloading capacity. A food waste pilot program began on Monday, 9/14.

- O&M costs for cogen engines Adam asks if EWA has annual O&M costs for the engines. Jimmy Kearns (Jimmy) states that EWA has annual costs for the maintenance schedule.
  - ACTION: Jimmy to send Adam maintenance schedule costs.
- WAS flow data
  - BC requests the WAS flow data, and Octavio indicates that EWA does have that data.
  - o ACTION: Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Air permitting summaries or progress
  - o Doug Campbell (Doug) sent Adam the latest email from Don King (Don).

#### **Outstanding Data Requests**

BC reviewed outstanding data requests with EWA. They included:

- Cogen drawing and cut-sheets
  - o Natalie Sierra (Natalie) points out that BC has received drawings from Andritz.
- Information on energy management
- High strength waste storage (typical day operating procedure)
- ACTION: Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.

There was a subsequent discussion on wasted gas that was being flared. Octavio explains that the operators need to manually control the digester gas flow to the dryer, which results in some flaring. Operators generally try to set the digester gas flow rate to avoid drawing down the gas system and triggering natural gas blending at cogen. This typically results in a conservative offtake of digester gas to the dryer which results in some flaring. Mike Steinlicht (Mike) asks how much is being flared, and Adam calculated that about 180 kW of gas was being flared (averaged over a month) in current operation.

Cogeneration operation was discussed. EWA operates two engines on digester gas 24/7. A third engine operates on natural gas during peak power rates. EWA physically disconnects from the power grid to avoid demand and consumption charges.

FOG is fed to the digesters at a constant rate of 12 gallons per minute. FOG is fed to only one or two digesters, not all. The FOG feeding begins on Monday with first deliveries of the week, and continues into Saturday to pump down material from the last deliveries on Friday.

#### **Meeting with Waste Haulers**

BC reviewed the timing, attendees, and goals of the Waste Haulers Meeting. Below is a summary of the discussion:

- Scott L reviewed the potential list of attendees, which included: EWA representatives, BC representatives, Waste Management (WM), Republic, EDCO, and potentially LES or Anaergia.
  - ACTION: Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Scott M stated that the intent of the meeting is to develop a public-private partnership and noted increase grant eligibility by having this kind of relationship.
- Mike emphasized that the elected officials want all of the waste haulers at the table, especially those that operate within EWA's service area.
- Adam reviewed the draft Waste Hauler Agenda, which would cover background on the plant, current operation, and a discussion of potential capacity.
- Scott M stated that he would like to have an agenda finalized and sent out to each waste hauler 30 days in advance of the meeting, to give them adequate prep time.
  - ACTION: Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments 30-days in advance of the meeting.
- Adam stated that another discussion point for the meeting is the waste haulers potential interest in accepting compressed natural gas (CNG). Scott M stated that SDG&E should be involved in these conversations as well. A meeting should be arranged with SDG&E.
  - o ACTION: Octavio to send EWA's SDG&E point of contact to Adam.
- Different gas delivery options, tube trailer vs. pipeline, were discussed. Adam stated that a
  tube trailer has less stringent standards than a pipeline, but there would be tube trucks coming in and out of the facility. However, the pipeline would have more stringent sampling/reporting requirements and the investment for an interconnection for the pipeline could cost
  \$1 2 million dollars. This will be developed as the alternatives analysis is advanced.

#### Other Outstanding Items

BC reviewed their understanding of the discussion with Anaergia:

Adam stated that Anaergia is promoting Omnivore as a process treatment option, which may
or may not be the right fit at EWA. However, there might be opportunity for Anaergia to work
with waste haulers for pre-processing food waste.

#### Review of Mass Balance and Project Flows and Loads

BC presented the project flows and loads:

- Mass Balance
  - Hari reviewed the assumptions made to calculated WAS. Octavio responded that the actual WAS flow is around 0.75 MGD, and that he could send that data to BC (ACTION above).
  - Adam stated that the VSR value of 65% seemed suspiciously high. Octavio stated that EWA's VSR value was closer to 55%.
  - Hari stated that the centrifuge % capture right now is 78%. Octavio responded that
    the capture rate for the centrifuges is consistently 95%, and that the calculated value
    is probably lower because of values during start-up and shut-down.
    - ACTION: Octavio to send Hari lab data on the performance of the centrifuges.

o Tom requested that the BC team review the data with Octavio after he send is to BC.

- ACTION: Tom to send up conference call with Octavio after reviewing the data.
- Solids Mass Balance Comparison
  - Tom presented a graph that shows that BC's calculated solids loading was higher than the calculated values in the Process Master Plan (2016).
  - Octavio stated that one reason for the increase might be a 2015 change in how EWA sampled the influent flow.
  - o ACTION: Tom to work with Octavio on refining the solids mass balance.
- Power Loads and Gas Usage
  - Adam reviewed the gas usage graphs with EWA.
  - Digester Gas Usage Summary Total gas production is trending up, probably due to the increase in high strength waste deliveries. Adam pointed out that the yellow "Total Gas Production" line didn't match up with the top of the bars, which is normal. Scott M pointed out that the important part is that the yellow line followed the same trend as the bars.
  - Natural Gas Usage Summary Most of the natural gas is being used for the heat dryer and cogen, which is expected.
  - Power Production and Import Currently, EWA is making about 80% of their electricity needs. This means that EWA could potentially export power. A look into the SDG&E power bills also showed that the actual kWh power that EWA is purchasing only constitutes \$10,000 out of a \$70,000 bill. The majority of the bill is non-coincident and standby power.
    - Mike stated that he had talked to SDG&E about the standby charges and haven't been able to get around them.
- Engine Fuel Use
  - Octavio explained that the increase in natural gas in November 2015 was because they needed to switch to natural gas to stay below emission limits.

#### Screening of Technologies

BC the fatal flaw filter and evaluation criteria, and then evaluated each process technology against that criteria. The results of the evaluation are summarized below and more details are included in the attached Workshop #2 PowerPoint slides.

- There were four fatal flaw filters:
  - o At least one successful North American installation of the technology
  - At least one successful installation in a facility of similar size
  - There is available space to implement that technology
  - Compatibility with plant size and any existing equipment
- The technologies that passed the fatal flaw filter were then scored for each evaluation criteria, which included: end use market compatibility, proven technology performance, life cycle costs, energy/resource recovery, O&M impacts, environmental impacts, community and stakeholder impacts, and project site combability.
  - Each evaluation criteria was then weighted to reflect EWA's priorities.

 Technologies that scored lower than a 3 were eliminated, and technologies that scored greater than a 3 would be evaluated through the SWEET model.

O&M impacts criteria will be clarified to describe reduction in O&M staff time.

#### Thickening Technologies

- Prior planning efforts recommended evaluating rotary drum thickeners (RDTs)
  against the existing primary clarifier and dissolved air flotation thickeners (DAFTs).
  EWA concurred with that recommendation.
- Natalie asked if the team should add Anaergia's Omnivore to the list of technologies to evaluate. Scott L proposed that that decision to be made after a meeting with Anaergia takes place.
  - DECISION: BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.

#### Stabilization Technologies

- Technologies that failed the fatal filter: Staged Digestion, Acid/Gas Phased Digestion, Temperature Phased Anaerobic Digesion, Enzymatic Hydrolysis, Chemical Hydrolysis, THP – DLD. and Solid Stream CAMBI.
- o Technologies that scored lower than a 3 in the evaluation criteria: Lystek.
- (DECISION) Stabilization technologies that moved to the next round of evaluation:
   Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.

#### Dewatering Technologies

- o Technologies that failed the fatal filter: Bucher Press.
- Technologies that scored lower than a 3 in the evaluation criteria: Screw Press, Rotary Press, and Volute Press.
- (DECISION) Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Press.
- Post-Dewatering Technologies
  - Technologies that failed the fatal filter: Thermal Drying: Low Quality (Indirect Dryer),
     Gasification, and Pyrolysis.
  - o Technologies that scored lower than a 3 in the evaluation criteria: N/A
  - (DECISION) Post-dewatering technologies that moved to the next round of evaluation:
     Thermal Drying: High Quality (Drum Dryer).
- Alternative Power Production Technologies
  - Technologies that failed the fatal filter: Fuel Cells and Wind Turbines.
  - Technologies that scored lower than a 3 in the evaluation criteria: Energy Storage (Batteries), Large Scale Solar Photovoltaics
  - (DECISION) Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines – with Gas Conditioning, Internal Combustion Engines – with Exhaust Treatment, Digester Upgrading – Pipeline Injection, Micro-Turbines, Biosolids Drying – Direct Use of Biogas, Large-Scale Solar Photovoltaics (PV), and Small Scale Rooftop PV.
- Waste Heat Technologies
  - Technologies that failed the fatal filter: Absorption and Adsorption Chillers, Organic Rankine Cycle, and Gasification of Biosolids.

- Technologies that scored lower than a 3 in the evaluation criteria: N/A
- (DECISION) Waste heat technologies that moved to the next round of evaluation:
   Small-Scale Steam Turbines, and Thermo/THP.

#### Creation of End to End Alternatives

The BC team reviewed initial alternatives that were to be evaluated, as well as different power production alternatives. The power production alternatives included:

- · Baseline: existing cogen and drying
- · Baseline with gas conditioning
- Existing cogen with vehicle fuel (via pipeline injection or tube trailer)
- Existing cogen with microtubines
- Existing cogen with steam boiler/turbine
- New cogen permit, CO catalyst and selective catalytic reduction (SCR), with gas conditioning
- · Vehicle fuel (primary use of digestive gas) with existing cogen
- ACTION: Adam to present a big picture view of the power production alternatives at the next workshop.

#### **Grant Updates**

BC provided an overview of different grant programs, and explained how the program would fit into the SWEET model. The programs included:

- Self-Generation Incentives Program
- Low Carbon Fuel Standard
- Renewable Fuel Standard
- Organics Grant Program
- · Healthy Soils Program
- Green Project Reserve

#### Air Permitting Discussion

BC and EWA discussed the current efforts of the air permit modification. EWA is submitting a request for permit modification in one week. If successful, it would increase the permitted cogen capacity by  $\sim 20\%$ .

#### Look Ahead & Wrap-Up

The meeting ended with a look ahead and reviewing pending action items.

- Workshop #3 will take place in mid-September, and the team will try to schedule the Waste Hauler Meeting on the same day.
- The team will present the following in Workshop #3:
  - o Baseline SWEET model
  - o Conceptual layouts and details of alternatives for consensus and feedback
  - Air permitting impacts on power production alternatives
  - Grant updates
- WEFTEC is also taking place in early-October. Mike stated that it would be beneficial to walk the floor together with BC to look at potential technologies.
  - ACTION: BC to identify technologies that would be beneficial to visit at WEFTEC.

• ACTION: BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

**Energy & Emissions Strategic Plan & Biosolids Management Plan Update** 

# Workshop #2 – August 16, 2017

**Encina Water Pollution Control Facility** 

# **Project Schedule**

- Progress On Schedule
- Task 1 Energy Baseline Complete
- Strategic Plan & Strategic Plan Update Other Tasks (except 7) are Under Way
- Workshop #2 Today

# Agenda

- Administrative (20 min)
  - Status of data requests
  - Comments on waste hauler agenda
  - Discussion with Anaergia
- Review Mass Balance and Projected Flows and Loads (45 min)
- Review Fatal Flaw and Screening Criteria (30 min)
- Screen Technologies (1 hr)
- Discussion of Preliminary End to End Alternatives (30 minutes)
- Grants Update (10 min)
- Air Emissions Review (5 min)
- Wrap-Up/Review Action Items (10 min)

## **New Data Requests**

- Trussell food waste capacity report
- O+M costs for the engines (have costs for electricity for the system, but not for gas treatment, upkeep, general maintenance, etc.)
- WAS daily flow data (back-calculated for mass balance)
- FOG TS and VS data (used assumptions from 2016 PMP for mass balance)
- Any air permitting summaries or progress between EWA and Don King

### **Outstanding Data Requests**

- Cogen and solids systems drawings, engine cut sheets
- Dryer system drawings and cut sheets
- Recent air permitting efforts progress, memos, contact info
- Copies of current air permits (SDAPCD and Title V)
- Energy Management typical day operating procedure:
  - Cogen strategy
  - Peak period disconnect from utility
  - HSW storage and feed strategy

# Waste Hauler Agenda

- Timing: September (coordinate with Workshop 3)
- Attendees:
  - EWA Scott, Jimmy
  - BC Adam, Ari
  - WM
  - Republic
  - EDCO
  - LES?
  - Anaergia?
- Goals:
  - Provide background info to haulers about EWA's goals and BEE effort
  - Determine availability of pre-processed food waste, market demand for an EWA initiative to receive more material, tipping fee range for SWEET analysis
  - Gauge interest in a renewable CNG partnership
  - Discuss "next steps" such as letter of intent, future coordination

# Other Outstanding Items

- Discussion with Anaergia
  - Omnivore as an alternative
  - Orex or Biorex for food waste pre-processing
  - and Caldwell Brown and Caldwell Prepared by Brown Status of food waste receiving project(s) with Republic
  - Capacity at Rialto facility for dried product?

# Review of Mass Balance and Projected Flows and Loads

### **Mass Balance**

#### **MAY 2015 - JUNE 2017**

9

### **Mass Balance Assumptions**

- TWAS flows that were zero and subsequent loads when TWAS flow was zero were excluded. Assumed percent capture rate for the DAFTs is 95%.
- TWAS flows were taken from DAFT totalizer data and digester feed meters.
- The digester feed flow from July 1, 2016 to June 2017 were subtracted daily to obtain a daily digester feed volume. This was based on the assumption that the flow values were cumulative from a meter reading starting 7/1/16.
- The Class B cake data were averaged with zero data to obtain an annualized daily average.
- FOG data were a daily average of the volumes received. This assumes FOG is fed 24/7/365. Assumes %TS and %VS are 5% and 82%, respectively.
- To calibrate the mass balance as shown, 2,300 lbs TS/d and 1,900 lbs VS/d were added to Primary Sludge.

### **Solids Mass Balance Comparison**

# Sludge Production Peaking Factors

	Max Month	Peak 2-Week	Peak Week	Peak Day
Primary Sludge	1.23	1.3	1.4	1.60
WAS	1.23	1.3	1.4	1.60
Combined Sludge	1.23	1.3	1.4	1.60

#### Notes:

- Peaking factors for maximum month and peak day conditions are developed based on 2016 PMP solids projections.
- Peaking factors for maximum 2-week and maximum week conditions are proposed based on historical data.

### **Power Loads and Gas Usage**

- Power:
  - Monthly production: 1,500 kW (2, 750 kW engines full output)
    - 80% of total electrical demand)
  - Monthly import: 385 kW equivalent (1,390 MWh per year)
- Digester gas:
  - Average production: 1,645,000 therms per year Caldwell
  - Engines: 1,263,000 therms per year
  - Waste gas: 229,000 therms per year
  - Heat dryer: 57,000 therms per year
- Natural gas: 856,000 therms per year
  - Engines: 156,000 therms/year
  - Other plant use: 700,000 therms/year

### Digester Gas Usage Summary – Last 2 years

- 1) What happened November 2015? DG outage?
- 2) Divergence of "total gas production" from sum of other meters
- 3) When DG is sent to the heat dryer, what contributes to flaring?
- 4) Flared gas, over the course of the last year, represents 179 kW of "potential" power production

### Natural Gas Usage Summary – Last 2 years

1) What is the NG control strategy to cogen? Why is there NG contribution to cogen in months where DG is being sent to dryer or flare?

### Power Production and Import – Last 2 years

- 1) Consistently operating at 2-engine output
- 2) Operating a third engine at full output (if DG production increases and/or permit is modified) would result in power export

### **Engine Fuel Use-Last 2 years**

- 1) Consistent operation
- What is NG blending strategy?

# **Screening of Technologies**

### **Fatal Flaw Filter**

- Applied uniformly across all technologies
- Four criteria:
  - At least one successful North American installation of technology
  - At least one successful installation in a facility of similar size
  - Available space
  - Compatibility with plant size and any existing equipment

#### **Evaluation Criteria**

Criterion	Criterion Description	Scoring Description
End Use Market Compatibility	<ul> <li>Onsite technology directly produces one of the recommended product alternatives.</li> <li>Alternately, onsite technology product is compatible with product alternatives.</li> </ul>	<ul> <li>Low score indicates technology product that has not been identified as part of the product list nor compatible with the product list.</li> <li>High score indicates technology product that is compatible with Class B cake, Class A cake, Class A THP cake, and dried Class A pellet.</li> </ul>
Proven Technology Performance	<ul> <li>Proven and reliable technology with same configuration intended at Encina.</li> <li>Long successful operating track record.</li> </ul>	<ul> <li>Low score indicates no successful large scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.</li> <li>High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration &gt; 5 years, and vendors in Western USA.</li> </ul>
Minimize Life Cycle Costs	<ul> <li>Qualitative metric of program cost.</li> <li>Capital and O&amp;M costs based on existing Encina data or similar experience at other WWTPs.</li> <li>Potential revenues from sales.</li> <li>Product/market geographic proximity.</li> </ul>	<ul> <li>Low score indicates high capital cost to build onsite facilities, high O&amp;M costs, expensive end use market, and high transportation costs.</li> <li>High score indicates low capital cost to build onsite facilities, low O&amp;M costs, potential product revenue, and product destination within 100 miles.</li> </ul>

#### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Energy/Resource Recovery	<ul> <li>Increases biogas production through advanced digestion.</li> <li>Supports co-digestion of organic waste.</li> <li>Recovery of renewable energy.</li> <li>Beneficial use of biosolids product.</li> </ul>	<ul> <li>Low score indicates high energy requirement for onsite technology, no increase in biogas production, technology does not recover energy as biogas, no recovery of renewable energy in biosolids, and no biosolids resource recovery.</li> <li>High score indicates a higher biogas production, compatible with co-digestion of organic waste, and biosolids resource recovery.</li> </ul>
O&M Impacts	<ul> <li>Impacts to existing plant O&amp;M staff levels.</li> <li>Complexity of new technology O&amp;M and control systems.</li> <li>Reliability of new technology (potential downtime).</li> <li>Minimal impacts to plant safety.</li> </ul>	<ul> <li>Low score indicates more O&amp;M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and new chemicals or hazards.</li> <li>High score indicates reduction in O&amp;M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new chemicals or hazards.</li> </ul>
	Minimal impacts to plant safety.	

#### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Environmental Impacts	Impacts to carbon footprint and air permitting.	<ul> <li>Low score indicates high carbon footprint for technology, high travel distance to end use, difficult to treat side-streams or impacts to GWRS, and new permitting for environmental regulatory requirements.</li> <li>High score indicates low carbon footprint for technology, low travel distance to end use, minimal side-stream generation or impacts, no additional permitting for environmental regulatory requirements.</li> </ul>
Community & Stakeholder	<ul> <li>Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.</li> <li>Assess impacts to partner agency issues/values as well as local planning codes and requirements.</li> </ul>	<ul> <li>Low score indicates nuisance factors for onsite technology are difficult to mitigate.</li> <li>High score indicates nuisance factors can be mitigated at plant site.</li> </ul>
Project Site Compatibility	<ul> <li>Assess compatibility of technology with available plant footprint.</li> <li>Incorporation into existing treatment process.</li> <li>Ability to accept co-digestion substrates.</li> </ul>	<ul> <li>Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant.</li> <li>High score indicates available footprint for new facilities and maintains space for future facilities, easy of integration with existing processes and facilities.</li> </ul>

#### **Evaluation Criteria Weighting**

Criterion	Weight Stabilization	Weight Dewatering	Weight Biogas Use and Waste Heat
End Use Market Compatibility	15%	15%	NA
Proven Technology Performance	15%	25%	20%
Minimize Life Cycle Costs	10%	20%	10%
Energy/Resource Recovery	20%	NA	25%
O&M Impacts	10%	15%	10%
Environmental Impacts	10%	5%	15%
Community & Stakeholder Impacts	10%	5%	10%
Project Site Compatibility	10%	15%	10%

#### **Creation of End to End Alternatives**

#### **Evaluating Technologies and Markets Together**

#### **Initial Alternatives**

- Meso plus second dryer
- Meso plus Class B hauling
- Thermophilic
  - Prepared by Brown and Caldwell With and without second dryer
- Cambi (traditional)
  - With and without second dryer

- Additional Layers
  - Thickening
  - Dewatering
  - Energy alternatives

#### **Alternatives: Power Production**

- Baseline: Existing cogen + drying
- Baseline + gas conditioning
  - Gas conditioning serves to reduce O&M costs associated with engines and dryer
- Existing cogen + vehicle fuel (via pipeline injection or tube trailer)
  - No permit modification to cogen / no DG to dryer
  - Continue to operate two engines
  - Additional gas routed to vehicle fuel
- Existing cogen + microturbines
  - Includes gas conditioning
  - No permit modification to cogen / no DG to dryer
- Existing cogen + steam boiler/turbine
  - No permit modification to cogen / no DG to dryer
  - Additional gas routed to steam boiler; steam used in small turbine
- New cogen permit, CO catalyst and SCR, gas conditioning
  - Need to consider plant demand as a limit on power production
- Vehicle Fuel (primary use of DG) + existing cogen (natural gas + tail gas)

"All in" on vehicle fuel

# Baseline includes cogeneration (permit limited), dryer and some flaring

#### Gas conditioning could reduce engine and dryer O&M costs associated with siloxanes

#### **Baseline with Gas Conditioning**

# With the existing permit in place, where else can we send digester gas to get highest value?

#### **Existing Cogen Options - No Permit Modification**

# A permit modification allows EWA to meet plant electricity demand, but any additional gas would need to go to a non-generating use

## An all-vehicle-fuel option may deliver the best economics

#### **Vehicle Fuel**

#### Alternatives to be presented at next workshop

- Process schematic
- Potential locations ssions Strategic Update

   Potential locations ssions

  Energy & Energy &

  - Prepared by Brown and Caldwell

## **Grant Updates**

#### **Self Generation Incentive Program**

Program	Self-Generation Incentive Program (SGIP)
Agency	California Energy Commission / administered by SDG&E
Eligible Projects	Self-generation projects such as new engines, microturbines, or steam turbines – increased incentives for renewable/biogas projects; Energy storage / batteries
Funding	Incentives based on anticipated power output – based on fuel availability, not nameplate capacity; 50% paid upfront / 50% paid over 5 years based on performance
Schedule	Funding available each year / first-come, first-served Battery funding decreases as tiers fill up Projects must be operational within 18 months of award
How much are we talking?	~\$500k - \$1M depending on project size
Recommendation for SWEET Analysis	Don't count on funding to justify project economics
Next steps	Continue to track / pursue if selected alternatives meet criteria

#### **Low-Carbon Fuel Standard**

Program	Low-Carbon Fuel Standard (LCFS)	
Agency	California Air Resources Board	
Eligible Projects	Part of AB 32 scoping plan – projects that reduce the carbon intensity of California's vehicle fuel – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, recently extended through 2030	
How much are we talking?	Varies could equate to $\sim 0.50/DGE - 1.00/DGE$ depending on market factors	
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2030, use conservative values	
Next steps	Continue to track / pursue if vehicle fuel is recommended	

#### Renewable Fuel Standard

Program	Renewable Fuel Standard	
Agency	US Environmental Protection Agency	
Eligible Projects	Renewable fuel projects – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, not guaranteed beyond 2022	
How much are we talking?	A lot of uncertainty: Wastewater digester gas is eligible for highest value of RINs – D3 EPA has recently stated that DG from food waste is a lower value – D5 EPA has the ability to set RIN quotas, which drive supply-and-demand, market-based pricing	
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2022, use conservative values	
Next steps	Continue to track / pursue if vehicle fuel is recommended	

## **Organics Grant Program**

Program	Organics Grant Program	
Agency	Department of Resource Recovery and Recycling (CalRecycle)	
Eligible Projects	Projects that serve to divert organics (food waste) from landfill – toward anaerobic digestion or composting; recently issued with a food rescue requirement	
Funding	Incentives based on project size and potential tons diverted	
Schedule	Recently awarded, not expected to reissue for ~18 months	
How much are we talking?	Up to \$4M per project	
Recommendation for SWEET  Analysis	Do not include – too competitive to count on	
Next steps	Continue to track / pursue if food waste receiving is recommended	

## Organics Grant Program - Recent Award

#### Recommendation:

Staff recommends approval of 10 grant awards, as listed in Table 1 below, for \$24,000,000.

Table 1. Organics Grant Program Recommended Award – List A

Applicant	County	Total Award
Anaerobic Digestion Projects		
County Sanitation Districts of Los Angeles County	Los Angeles	\$4,000,000
HZIU Kompogas SLO, Inc.	San Luis Obispo	\$4,000,000
Rialto Bioenergy Facility, LLC	San Bernardino	\$4,000,000
	Subtotal	\$12,000,000
Compost Projects		
City of San Diego	San Diego	\$3,000,000
Mid Valley Recycling, LLC	Fresno	\$1,875,000
Salinas Valley Solid Waste Authority	Monterey	\$1,341,865
Recology Yuba-Sutter (partially funded)	Yuba	\$2,783,135
	Subtotal	\$9,000,000
Rural Compost Projects		
Napa Recycling & Waste Services, LLC	Napa	\$541,700
South Lake Refuse Company, LLC	Lake	\$1,218,026
West Coast Waste (partially funded)	Madera	\$1,240,274
	Subtotal	\$3,000,000
	Grand Total	\$24,000,000

## **Organics Grant Program - Recent Award**

Table 2. Organics Grant Program Recommended Award - List B

Applicant	County	Total Award Requested*
Anaerobic Dig	estion Projects	
CR&R Incorporated	Riverside	\$4,000,000
Contra Costa Waste Services	Contra Costa	\$4,000,000
City of Manteca	San Joaquin	\$1,500,000
Santa Barbara County	Santa Barbara	\$4,000,000
Subtotal		\$13,500,000
Compost	Projects	
Recology Yuba-Sutter (partially funded)	Yuba	\$216,865
Agromin OC, LLC	San Bernardino	\$600,000
Waste Management of Alameda County, Inc.	Alameda	\$3,000,000
GreenWaste Recovery, Inc.	Santa Clara	\$1,700,000
Burrtec Waste Industries, Inc.	Riverside	\$3,000,000
Arakelian Enterprises Inc. DBA Athens Services	San Bernardino	\$3,000,000
Best Way Disposal Company, Inc. DBA Advance Disposal Co.	San Bernardino	\$2,481,250
Kern County	Kern	\$3,000,000
City of Oceanside	San Diego	\$1,178,351
Subtotal		\$18,176,466
Rural Comp	ost Projects	
West Coast Waste (partially funded)	Madera	\$161,326
Upper Valley Disposal Service	Napa	\$1,250,000
Subtotal		\$1,411,326
	Grand Total	\$33,087,792

# **Heathy Soils Program**

Program	Healthy Soils Program
Agency	California Department of Food and Agriculture
Eligible Projects	Demonstration projects that sequester carbon and reduce GHG emissions – groups within CASA
Funding	Incentives based on project size and potential GHG benefit
Schedule	Currently accepting applications through September 19 Annual funding program (AB 32 funds), amounts and criteria may vary
How much are we talking?	Up to \$3.75M total
Recommendation for SWEET Analysis	Do not include / ancillary benefit to support end use program
Next steps	Continue to track / connect with CASA Science and Research Group for potential partnerships

## **Green Project Reserve**

Program	Green Project Reserve
Agency	California Water Resources Control Board
Eligible Projects	Projects that improve energy efficiency, renewable energy generation, or recycled water production
Funding	A component of Clean Water State Revolving Funding; Green Project Reserve is a "loan forgiveness" program CWSRF is generally oversubscribed, but GPR is underutilized
Schedule	Ongoing
How much are we talking?	Up to \$4M per project, or 50% of project value, whichever is higher
Recommendation for SWEET Analysis	Do not include
Next steps	Something for EWA to keep in mind – if a larger capital project requires funding, consider CWSRF and adding an eligible GPR component

# **Air Permitting Discussion**

## EWA is actively pursuing air permit modification

- EWA (with Don King) will submit a request for permit modification within ~1 week
- Goal is to adjust the CO emission rate from 530 ppm to ~400 ppm, and thereby adjust the fuel input limit aimed at keeping CO emissions below Title V synthetic minor threshold
- If successful, this effort would increase permitted cogen capacity by ~20%
- This increase would allow EWA to meet plant electricity demand with current digester gas flows and cogen system

# Look Ahead & Wrap-Up

## **Project Schedule**

- Workshop #3 in mid-September
- Draft Analysis and Reports to Begin

## **Look Ahead – September Workshop**

- Consensus on mass balance/baseline
- Conceptual layouts/details of alternatives for consensus/feedback (example numbers to support including biogas production, food waste that can be imported)
- Air permitting impacts on power production alternatives
- Informational meeting with waste haulers
- Debrief on Anaergia meeting
- Grants update

# Wrap-Up

# QUESTIONS?

## **Attachment B: Map of California Land Application Ordinances**

Source: California Association of Sanitation Agencies

## **Biosolids Land** Application in California

## **Attachment C: Digestion Volume Calculations**

### **Pre-THP Dewatering**

### **Assumptions:**

Pre-THP dewatering feed solids flows and loads are the same as the digester feed flows and loads on the Digestion tab.

Current solids flows and loads from "Peaking" tabs. 2040 flows and load provided by Tracy Chouinard.

	Current				2040				
Pre-THP Dewatering Fee	Avg	Max Month	Max 2-Week	Max Day	Avg	Max Month	Max 2-Week	Max Day	
TS (lb/day)	94,380	109,731	138,681	138,681	108,100	132,000	139,500	170,800	
VS (lb/day)	80,520	92,715	97,111	97,111	91,415	111,676	118,019	144,543	
%TS	4.52%	4.85%	5.85%	4.15%	4.68%	4.67%	4.67%	4.67%	
Flow (GPD)	250,425	271,335	284,379	400,440	277,250	338,974	358,205	438,946	

Pre-THP Dewatering Centrifuge
-------------------------------

330	gpm
330	Spill

Flow (gpm)	174	188	197	278	193	235	249	305
No. of Duty Unit	0.53	0.57	0.60	0.84	0.58	0.71	0.75	0.92
No. of Standby Unit	1	1	1	1	1	1	1	1
Total No. of Unit	2	2	2	2	2	2	2	2
Solids capture rate	98%	98%	98%	98%	98%	98%	98%	98%
Solids to THP (ppd)	92,492	107,536	135,908	135,908	105,938	129,360	136,710	167,384

Centrifuge Recommendation

Recommend two 29inch bowl units

Alfa Laval G3-125 dimensions: 5' x 23'

#### Cambi THP Unit Capacity

	Peak Day	Other
	ton/day	ton/day
B2-1	6.5	6.2
B2-2	13	12.4
B2-3	19.5	18.5
B2-4	26.1	24.8
B6-2	46	43.7
B6-3	70	66.5
B6-4	93	88.4
B12-3	99	94.1
B12-4	119	113.1

THP	Current				2040			
	Avg	Max Month	Max 2-Week	Max Day	Avg	Max Month	Max 2-Week	Max Day
Solids to THP (dtpd)	46.2	53.8	68.0	68.0	53.0	64.7	68.4	83.7

#### **THP Recommendation**

Recommend one B6-4 unit B6-4 dimensions: 27' x 33'

#### Cake Bin Recommendation

Since 1 B6-4 has sufficient capacity for 2040 peak day solids production, no cake storage is needed.

Cake bins will only need to provide a working volume (~ 30 cy) to feed the THP.

Recommend two cake bins (one per centrifuge), each with a capacity of 50 cy.

Preliminary bin size, each, LxWxH = 14x10x14

#### Odor Control

SFPUC solids loads 220 dtpd, odor control (biofilter) approximately 60 x 90 Encina solids loads 84 dtpd, assume odor control will be 1/3 of SFPUC, say 60 x 30

#### Digester Sizing

#### Summary of Results

,	Current	2040
Conventional Mesophilic Anaerobic Digestion (CMAD)	Existing digesters have sufficient capacity for current flows and loads	Service condition HRT is slight less than 15 days (14.7 days) with existing digesters. Probably ok.
Thermophilic Anaerobic Digestion (TAD)	Existing digesters have sufficient capacity for current flows and loads	Service condition HRT is slight less than 15 days (14.7 days) with existing digesters. Probably ok.
Class A Batch Tanks	Need 4 new batch tanks (0.48 MG each) or, 3 new batch tanks (0.3 MG each) and retrofit 3 existing small digesters (0.3 MG each)	Need 4 new batch tanks (0.48 MG each) or, 3 new batch tanks (0.3 MG each) and retrofit 3 existing small digesters (0.3 MG each)
Staged Mesophilic Anaerobic Digestion (SMAD)	One new digester is required to operate in SMAD mode. Typical operation would be three first stage and one second stage digesters. Piping configuration should allow one of the first stage digesters function as second stage digester.	One new digester is required to operate in SMAD mode. Typical operation would be three first stage and one second stage digesters. Piping configuration should allow one of the first stage digesters function as second stage digester.
Acid/Gas Anaerobic Digestion (AGAD)	Requires two acid reactors, 400,000 gallons each. Preliminary sizing: 45' dia. 34' SWD. Existing digesters have sufficent capacity to function as gas reactors.	Requires two acid reactors, 400,000 gallons each. Preliminary sizing: 45' dia. 34' SWD. Existing digesters will function as gas reactors. Service condition HRT is slightly less than 15 days (14.8 days). Should be ok.
Temperature Phased Anaerobic Digestion (TPAD)	Existing digesters have sufficient capacity for current flows and loads to operate in TPAD mode. Typical operation would be two thermophilic digesters and one mesophilic digester. Equipment and piping configuration should allow one thermophilic digester operate as a swing digester.	Typical operation would be two thermophilic digesters and one mesophilic digester. Equipment and piping configuration should allow one thermophilic digester operate as a swing digester.  With existing digesters, HRT at the service conditon is lower than design values. Thermophilic phase HRT is 7.4 days, the potential for microorganism washout is high. Recommend building one new thermophilic phase digester.

Current solids flows and loads from "Peaking" tabs. 2040 flows and load provided by Tracy Chouinard

## **Executive Summary**

The Encina Water Pollution Control Facility (EWPCF) currently has four 750-kilowatt (kW) internal combustion (IC) engines that produce 83 percent of the plant's electrical power demand as well as heat for the wastewater process. The engines are primarily fueled with biogas from the plant's anaerobic digesters, but also pipeline natural gas (NG) under certain scenarios. The engine fuel input, and electric generation output, is limited by an air permit that generally restricts the plant to operation of two engines (biogas fuel), with a third engine (NG fuel) used during peak electric rate periods. Biogas production exceeds the permitted capacity, so excess biogas is directed to the plant's heat dryer or flared. Driven by a high non-coincident power demand cost and a goal to produce 95 percent of power at the plant, Encina Wastewater Authority (EWA) is evaluating alternative power production technologies to reduce costs and recover maximum value from biogas. This Technical Memorandum (TM) 3 describes the development of screening and evaluation criteria for the assessment of alternative power production technologies. Technologies evaluated include IC engines, microturbines, biogas upgrading, solar photovoltaics (PV), battery storage, fuel cells, wind turbines, and sale of biogas to the adjacent Encina Power Station. Screening and ranking of technologies was performed in a workshop with EWA staff on August 16, 2017. Technologies that did not pass the fatal flaw filter were eliminated. Those technologies that passed the fatal flaw filter moved on and were assessed using evaluation criteria developed to reflect EWA's values and project goals, and are summarized in Table ES-1. Power production alternatives that will be further refined and analyzed using Brown and Caldwell's (BC's) Solids Water Energy Evaluation Tool (SWEET) include those that received an overall score of 3 or higher in the scoring evaluation where higher scores are more favorable over low scores and scoring is specific to the EWPCF. Alternatives presented in Table ES-1 can serve as standalone alternatives or be combined to create 'hybrid' alternatives, which may provide the best of both worlds.

Table ES-1. Alternatives Scoring Evaluation										
	IC Engines - Status Quo	IC Engines - with Gas Conditioning	IC Engines - with Exhaust Treatment	Biogas Upgrading: Pipeline Injection	Biogas Upgrading: Vehicle Fueling (CNG)	Microturbines	Biosolids Drying	Energy Storage (Batteries)	Small-Scale Rooftop PV	Large-Scale PV

### **Section 1: Introduction**

EWA has undertaken a Biosolids Energy and Emissions Plan (BEE Plan) which will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- 1. Provide a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat;
- 2. Address capacity limitations in the solids handling process at the EWPCF;
- 3. Assess which alternative is likely to be the most cost effective and sustainable solution for EWA;
- 4. Move the EWPCF toward lower energy costs, rate stability, and greater overall sustainability.; and
- 5. Reduce greenhouse gas emissions (GHGs).

The purpose of TM 3 is to conduct a technology screening for alternative power production methods that could help EWA move toward their goal of greater energy independence. Alternatives evaluated in this TM do not consider potential energy reduction measures at EWPCF; the focus is placed on power production. This TM does not provide an alternatives analysis but provides insight into the methodology and rationale used to select alternatives which will move forward for further analysis in the SWEET model development.

### 1.1 TM 3 Purpose and Scope

This TM is preceded by TM 1 which addressed the baseline energy profiles and projections, established a mass balance for the solids handling system, and evaluated sludge flows and loads projections performed under the Process Master Plan. Screening and evaluation of solids processing technologies is described in TMs 1 and 2, including derivation of the biogas projections used in the alternatives evaluation presented in this TM.

TM 3 summarizes the methodology for screening and evaluating alternative power production technologies, the technologies evaluated, and how these alternatives were ranked to determine which would move forward in the SWEET analysis. While an emphasis was placed on those technologies that utilize the biogas generated from sludge digestion, additional alternatives such as solar and wind power were also investigated. Non-power-producing technologies, such as biogas upgrading, are included in the evaluation – recognizing that these alternatives help EWA realize its goals of economic and environmental benefits. Recommended technologies will be advanced for further analysis and will be combined with the solids handling and waste heat alternatives presented in TMs 2 and 5. Screening and ranking of technologies were performed in a workshop with EWA staff on August 16, 2017. Meeting minutes from this workshop have been provided as Attachment A.

## 1.2 Background Information

The EWA cogeneration system has four Caterpillar 3516 IC engine-generators installed in the Power Building; each engine-generator can generate a maximum of 750 kW. Currently, one IC engine at the EWPCF serves as a standby unit, with the other three IC engines available for cogeneration. The existing engines are capable of operating on either biogas, NG, or blended biogas and NG. NG is blended with air at the eclipse units to reduce the British thermal units (Btu) value to biogas values, it is then introduced to the biogas header feeding both the engines and the thermal biosolids dryer. This only occurs based on header pressure during times of high biogas demand. There is no biogas conditioning upstream of the engine-generators.

During peak electrical hours, the EWA operates generators to match the plant electrical demand and allow the plant to disconnect from the electrical grid, receiving compensation from the electrical utility for this arrangement (NG EMP). During these periods, a third engine is brought on line and operates on NG to increase engine-generator output.

EWA is pursuing modifications to its air permit to increase the permitted generating capacity of the plant. Because this effort is a work in progress, this TM reflects the current air permit and the screening process presents the relative comparisons of emissions. It is assumed that exhaust treatment is required to increase permit capacity, but the ability of each technology to meet air permitting requirements needs further verification as the permit process unfolds.

The current and future biogas projections are discussed in greater detail in TM 1. These projections assume the current high strength waste (HSW) quantities will be imported for codigestion and the future increase in biogas production is a result of the increased municipal sludge loadings only. A summary of the projections is shown in Table 1-1.

Table 1-1. Projected Biogas Production						
	Current	2020	2030	2040		
scfm	501	528	619	709		
therms/year	1,581,000	1,666,000	1,951,000	2,235,000		

<sup>&</sup>lt;sup>1</sup> Projected biogas production is based on current wastewater and alternative fuels loadings. Potential for additional biogas from codigestion of additional alternative fuels is presented in TM 4.

scfm = standard cubic feet per minute

# Section 2: Identification of Technologies for Alternative Power Production and Fatal Flaw Screening

The BC team worked with EWA staff to identify an initial list of alternative technologies that could contribute to increasing the on-site energy production powered by renewable fuels. The initial list includes the following:

- Continued use of the existing internal combustion engines
  - With gas conditioning
  - With gas conditioning and exhaust treatment
- Biogas upgrading
  - Pipeline injection
  - On-site vehicle fueling
- Microturbines
- Biosolids drying direct use of biogas
- Energy storage (batteries only. HSW storage and biogas storage are included in TM 4)
- Fuel cells
- Large scale solar photovoltaics (PV)
- Small scale/rooftop solar photovoltaics
- Wind turbines
- Direct sale of biogas to Encina Power Station

These technologies are discussed in subsequent sections in further detail. The alternative power production technologies were first screened using four fatal flaw criteria that were developed in conjunction with EWA staff. The fatal flaw screening criteria include the following:

- At least one successful North American installation of technology. There must be at least one full-scale installation of the technology at a wastewater treatment plant (WWTP) in North America.
- At least one successful installation and operation in a facility of similar size. The technology should be sufficiently developed that it is applicable at a facility of comparable size to EWPCF to ensure compatibility.
- Available space. The technology must be accommodated within the limited available footprint at EWPCF.
- Compatibility with plant site and any existing equipment. The technology must be capable of being integrated into the existing treatment plant infrastructure.

For an alternative to be considered for the ranking process, the alternative must pass all four fatal flaw criteria.

### 2.1 Internal Combustion Engine-Generators

This alternative assumes biogas is used as the primary fuel to the existing IC engine-generators to cogenerate heat and electricity. Current operation of the four 750 kW IC engines was discussed in Section 1.2. As mentioned, EWA is pursuing an alternative air emissions strategy via an air permit modification to increase use of available generating capacity. A revised permit strategy may require the addition of gas conditioning, exhaust treatment, or a combination of these possibilities and will be discussed in TM 4. Additionally, instead of pursuing an alternative air emissions strategy, microturbines (discussed in Section 2.3) may be paired with the IC engines to increase the electrical generating capacity of EWPCF. In this case, exhaust treatment would not be required, but upstream gas conditioning would be needed to meet inlet requirements of the microturbines. Figure 2-1 shows the existing engines located in the power generation building.

Figure 2-1. Existing 750 kW Caterpillar engines at EWPCF

In addition to the current IC engines operating at 750 kW electrical output, a second variation was considered for the evaluation in which engines would return to rich burn operation to provide 900 kW electrical output. EWPCF's original permit was for 0.5 grams of NOx per brake horsepower-hour and to achieve this level of nitrogen oxide (NOx) emissions, the original 900 kW engine was derated to 750 kW and a 750 kW generator was installed as part of the package. BC reviewed this alternative and does not recommend this alternative be carried forward since 1) the modified November 2017 air permit allows EWA to run engines at nearly plant demand; and 2) changing the engine generator output would likely require a permit modification.

With several of the IC engines' sub alternatives, in conjunction with microturbine and solar alternatives that will be discussed in Sections 2.3, 2.7 and 2.8, EWPCF may generate more power than is required to operate the plant. If power production exceeds demand, EWPCF may be able to earn revenue through exporting power to the grid. Net metering power to the grid is discussed further in Section 2.11.

IC engines have been used at EWPCF since 1983 to generate electrical power to reduce electricity costs for EWA. The engines also provide a source of emergency standby power to meet EWA's National Pollution Discharge Elimination System permit. Since the plant already operates four 750 kW IC engines, this alternative passes all fatal flaw criteria; i.e., the engines successfully generate power, they are already located at the plant, and are compatible on the existing site. The IC engines alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

## 2.2 Biogas Upgrading and Beneficial Use

Biogas upgrading produces biomethane, a renewable NG substitute that can also be used as vehicle fuel as compressed NG (CNG). Similar to conventional gas treatment systems that remove contaminants to improve engine performance, biogas upgrading first involves gas conditioning to remove moisture, hydrogen sulfide, and siloxanes from the raw biogas and gas compression. After contaminants are removed from the gas, the gas goes through a separation process to separate methane from carbon dioxide. The resulting product is a methane-rich process gas (biomethane or renewable NG) and a methane-lean tail gas consisting primarily of carbon dioxide with up to 25 percent of the total biogas methane depending on the selected separation system. Tail gas is typically wasted using a flare or thermal oxidizers and typically requires a supplemental NG feed to help the tail gas combust.

There are several biogas separation technologies available including membranes, pressure swing adsorption, and water solvents. Figure 2-2 shows an example biogas upgrading system provided by Unison Solutions that utilizes membrane separation. Other typical biogas separation technology manufacturers include Air Liquide, Guild, and Greenlane. These technologies will be described in greater detail in TM 4.

Figure 2-2. Biogas upgrading system at San Mateo WWTP (CA) using Unison's BioCNG system Includes hydrogen sulfide removal, moisture removal, compression, siloxane removal, and membrane separation.

Upgraded biogas is either routed to a pipeline injection system or to on-site storage and dispensing of vehicle fuel, both described below in Table 2-1. Upgraded biogas can also be sent to a tube trailer to transport to an off-site fueling facility; in this case, the upgraded biogas must meet the on-site vehicle fueling criteria but requires less on-site storage. Southern California Gas Rule No. 30 (Transportation of Customerowned Gas) provides requirements for gas to be injected into the utility pipeline; this rule was used to derive the values in Table 2-1. Vehicle fueling specifications are based on generally acceptable values for CNG engines, such as Cummins-Westport. Vehicle fuel standards are generally less stringent than California's NG pipeline standards.

Table 2-1. Comparison of Biogas Upgrading Pipeline Injection and Vehicle Fuel					
	Vehicle Fueling	Pipeline Injection (Rule No. 30)			
Methane, percent by volume, min	95	99			
Carbon dioxide, percent by volume, max	3.0	3.0			
Oxygen, percent by volume, max	0.1	0.2			
Sum of carbon dioxide, nitrogen, oxygen percent by volume, max	5.0	4.0			
Higher heating value, Btu/scf, min	960	990			
Water, lb / million scf, max	7	7			
Hydrogen sulfide, ppmv, max	4	4			
Mercaptan sulfur, ppmv, max		5			
Total sulfur, ppmv, max	16	12.6			
Total measurable siloxanes, ppbv, max	100				
Total ammonia, ppmv, max	10				

Table 2-1. Comparison of Biogas Upgrading Pipeline Injection and Vehicle Fuel

Other volatile organic compounds, ppbv, max	100					
Free of dust and gum, filtration to, micron, max	0.3					
Discharge Pressure, psig	4500	Depends on injection location				
Example Facilities	Janesville, WI San Mateo, CA	Point Loma, CA				

Ib = pounds; ppbv = parts per billion by volume; ppmv = parts per million by volume; psig = pounds per square inch gage; scf = standard cubic feet.

Both biogas upgrading alternatives are eligible for incentives under by the Low Carbon Fuel Standard (LCFS) and Renewable Fuel Standard (RFS2). The LCFS is a state-administered program with a goal to lower greenhouse gas emissions from petroleum-based transportation fuels by requiring producers of petroleum-based fuels to reduce the carbon intensity (CI) of their products by either developing their own low-carbon fuel products or purchasing LCFS credits from other companies or producers that develop and sell low-carbon alternative fuels. Credits are a tradable environmental commodity with a monetary value and are typically managed by a third-party broker. Similarly, the RFS2 is an EPA program that requires transportation fuel to contain a minimum volume of renewable fuels. Renewable fuel sources include biomass-based diesel, cellulosic biofuel, advanced biofuel, and total renewable fuel. The RFS2 mandates that fuel refiners obtain renewable fuel credits called Renewable Identification Numbers (RINs) to meet a minimum percentage of renewable fuel production.

Sending biomethane to the existing San Diego Gas & Electric (SDG&E) pipeline would allow for more flexibility with operations by allowing biogas to be processed as it is produced rather than storing it, and requires less space at the plant than vehicle fueling. Injected biomethane can be sold to any party with a physical connection to California's NG grid. The sale is typically managed through a third-party broker. This alternative is similar to the Point Loma WWTP, a 175 million gallons per day (mgd) plant, which currently produces biomethane and injects it to the SDG&E NG pipeline through a service-provided contract with BioFuels Energy, LLC.

On-site vehicle fueling requires additional equipment for compression, storage, and dispensing of CNG. High pressure CNG compressors are required to boost the pressure of the gas up to approximately 4,500 pounds per square inch gage (psig). On-site fueling requires EWA to find a committed, local partner who can use the renewable CNG fuel. The amount of fuel produced requires an agreement with a large vehicle fleet, such as buses or solid waste collections. Identification of a partner is critical to this option moving forward. Figure 2-3 shows an installation photograph of these high pressure CNG compressors. Figure 2-4 shows high pressure CNG storage vessels and a typical fuel dispenser.

Figure 2-3. Example of ANGI high pressure compressors

Figure 2-4. Example of ANGI vehicle fueling equipment, including high pressure storage and fuel dispenser

As an alternative to on-site vehicle fueling, vehicle fuel-quality biomethane may be transported to an off-site fueling facility via a tube trailer. This option eliminates the need for on-site storage but still requires a committed local partner. Transporting biomethane in tube trailers was discussed in a meeting with waste haulers that operate near EWPCF. These haulers were not interested in receiving tube trailers and preferred obtaining NG directly from the pipeline. Additionally, hauling costs for the significant quantity of biomethane that can be produced at EWPCF are likely to be prohibitive. For these reasons, hauling biomethane in tube trailers is not a viable option.

Neighbors at the Point Loma WWTP currently upgrade their biogas to biomethane or renewable pipeline NG. One difference to note is that Point Loma staff do not operate or maintain the gas upgrading equipment—the gas is sold to BioFuels Energy, LLC. This private entity operates the biomethane gas purification and injects the upgraded biogas into the pipeline for use. While Point Loma WWTP is under a service type contract for sale of their biogas, the project still demonstrates that a full-scale project is feasible. Biogas upgrading equipment could fit near the existing digesters or where the old Maintenance Building is located. The biogas upgrading alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

### 2.3 Microturbines

Microturbines are small combustion turbines that cogenerate heat and electricity. Packaged microturbine units are available in capacities ranging from 65 to 333 kW per unit. Microturbines are a compact, easily scalable, low-emission technology for utilizing biogas. Microturbines are extremely sensitive to siloxanes and require gas conditioning to remove sulfides, moisture, and siloxanes and require compression up to 80 psig. One of the disadvantages, in comparison to IC engines, is a lower electrical efficiency; microturbines have an efficiency of 30 to 32 percent while IC engines see an efficiency of 35 to 40 percent. The two main microturbine manufacturers are Capstone and FlexEnergy, both companies with factories in the United States. Figure 2-5 shows a microturbine package installation with capability of producing 1,000 kW. Microturbines are capable of operating on the tail gas of a membrane separation biogas upgrading system where energy content is as low as 300 British thermal units per cubic foot to replace a flare or thermal oxidizer.

Figure 2-5. Capstone C1000, 1000 kW microturbine package with integrated exhaust manifold

Microturbines would not replace the existing IC engines, but would be added to increase power generation. They would run continuously and simultaneously with the existing engines and would maximize biogas utilization for combined heat and power. Because microturbines produce low emissions in comparison to an IC engine, coupling them with IC engines is a viable alternative to pursuing permit modifications and associated exhaust treatment for the IC engines.

Several treatment plants in the United States operate Capstone microturbines including Janesville, Wisconsin; Sheboygan, Wisconsin; Durango, Colorado; Persigo, Colorado; and Santa Margarita, California—all of which have reported successful operation. Microturbines would be used at EWPCF to supplement power production in conjunction with existing IC engines and multiple units could be installed. Microturbines have a relatively small footprint and would fit onto the site easily. However, because microturbines require gas treatment, the conditioning system footprint was also considered when determining space availability. The microturbine alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

### 2.4 Direct Use of Biogas in Drying

Biogas can be blended with NG and used to fuel a sludge dryer. EWA currently operates an Andritz DDS40 sludge dryer, which, according to current equipment specifications, can utilize a maximum 82 percent biogas and 18 percent NG blend. However, Andritz has stated that the DDS40 has been fueled with 100 percent biogas at certain facilities and Andritz is under contract to perform biogas optimization for the dryer at EWPCF. EWA currently uses excess biogas in typical dryer operations. Dryer fuel requirements are dependent on sludge flow; greater flows signal a greater capacity to utilize biogas. Under the current operating strategy, EWA's biogas use is lower than the maximum allowed by Andritz for biogas blending; therefore, the dryer has capacity to consume additional biogas. Biogas utilization can be further increased if Andritz determines a greater biogas blend may be used. If a second dryer is installed to accommodate increasing sludge flows, the dryer system would have even more capacity to consume excess biogas.

Since the plant already uses biogas in the solids dryer and has capacity to consume additional biogas for biogas, this alternative passes all fatal flaw criteria and will be carried forward in evaluation screening.

### 2.5 Energy Storage (Batteries)

Without energy storage, power that is generated at a WWTP must be utilized as it is produced. With energy storage, a WWTP can store excess power during low demand periods and use the stored power to reduce peak electricity demand, also known as energy arbitrage. Combining on-site power generation with energy storage can reduce electricity bills by decreasing both overall energy consumption and non-coincident demand charges. Battery storage is typically provided with microgrid controllers that manage the storage and deployment of power.

Lithium-ion batteries are the most common energy storage technology and have only recently been applied at a WWTP. Lithium-ion batteries are rechargeable and operate through the movement of lithium ions between negative and positive electrodes, however, there are energy losses as the battery charges and discharges. In 2016, Napa Sanitation District partnered with Tesla to install five batteries that can capture 1 megawatt (MW) and store 2 MW hours (MWh) of electricity. The Tesla batteries at Napa Sanitation District are shown in Figure 2-6. Other manufacturers, including LG, Mercedes, and Nissan, are developing their own large capacity batteries.

Figure 2-6. Napa Sanitation's Tesla Batteries

Note: Five units can store 1 MW/2 MWh of electricity.

Napa Sanitation District implemented a battery storage project in partnership with Pacific Gas & Electric and Tesla in 2016. The plant installed five Tesla batteries to capture and store 1 MW/2 MWh of electricity. Tesla has also partnered with Southern California Edison to install an 80 MWh project at the Mira Loma substation in January 2017. Additionally, Inland Empire Utilities Agency is installing batteries at several facilities in Southern California in conjunction with Advanced Microgrid Solutions. The energy storage via batteries alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

### 2.6 Fuel Cells

Fuel cells produce electrical power directly through an electrochemical reaction that uses hydrogen and oxygen. For application at EWA, a fuel cell would use methane as a hydrogen fuel source and air as an oxygen source. To utilize biogas in the fuel cell, the biogas would require upstream gas conditioning to remove sulfur, siloxanes, metals, and moisture. Gas quality requirements for fuel cells are higher than for IC engines, since small amounts of contaminants can ruin fuel cell stacks.

Fuel cells are not charged prior to use like batteries described in Section 2.5 and are instead fed hydrogen and oxygen continuously to provide a constant power output. The reaction does not involve combustion, has no moving parts, and has very low emissions of criteria pollutants. Figure 2-7 demonstrates the basics of how a fuel cell works—hydrogen is fed to the anode and oxygen is fed at the cathode. As hydrogen moves from the anode to the cathode through an electrolyte, electricity is created. Molten carbonate fuel cells are the most common types of fuel cells and have an electrical efficiency of roughly 45 percent.

(Source: www.fuelcells.org)

Figure 2-7. Fuel cell electricity generation process diagram

While fuel cells are an established technology with multiple manufacturers and thousands of installations in the world, many treatment plants have reported problems with operation on biogas with numerous fuel cells abandoned. Fuel cells were a popular option for WWTPs in the 2000s due to direct subsidies; however, these subsidies have ended, making this alternative less economically attractive.

Fuel cells do not pass the fatal flaw filter on technology maturity and successful operation criteria. While fuel cell technology reportedly has air emissions benefits and high electrical efficiency, numerous treatment plants have reported poor fuel cell performance and no longer operate their units (e.g., the San Jose-Santa Clara Regional Wastewater Facility, Inland Empire, King County, and New York City). Additionally, the grants and subsidies that once made fuel cells financially attractive are no longer in place and would mean high life-cycle costs. The fuel cell alternative fails the fatal flaw filter on technology maturity and successful operation and will not be carried forward in the evaluation screening.

### 2.7 Large-Scale Photovoltaics

For large-scale solar projects at wastewater treatment plants, the majority are installed by third party developers who have access to federal tax credits, which are limited to private entities. Power is typically sold back to the utility at a fixed rate with inflation escalation. The third party typically pays for capital costs and operations and maintenance (O&M) of the system since the plant will continue to pay for the cost of power. This third-party arrangement is called a power purchase agreement. EWA has the option to use a power purchase agreement, or own its own system.

EWA has identified available space for a large-scale solar project on the southeast parcel of the plant. The estimated available footprint is 13 acres, unless the plant reserves this space for future processes. Additionally, Figure 2-8 demonstrates a high amount of solar resource near the EWPCF.

Figure 2-8. PV solar radiation intensity

A major disadvantage of PV systems is that solar power is intermittent as sunlight quantity and intensity vary greatly throughout a day. The best solar conditions occur in the middle of the day, and the power demands of WWTPs do not follow the same diurnal cycle as the rest of the electrical grid. Coupling energy storage with PV systems can increase the benefits of solar power by allowing power to be provided as needed, not as produced. This is especially true for facilities like EWA that would like to maximize renewable power consumption without exporting power to the grid during peak solar production periods.

As mentioned previously, solar PV is a mature technology with numerous successful operations. Large-scale solar PV uses the same technology as rooftop solar panels on a larger scale (greater than 1 MW). Large-scale solar PV would require approximately 5 acres of panels and could be located on the south parcel of the plant. The large-scale solar PV alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

#### 2.8 Small-Scale Photovoltaics

Small-scale PV systems have less than 1 MW of electricity generating capacity and can range in size from a single panel used to power an instrument to a moderately sized solar array installed across a few acres of land. Smaller systems are typically more expensive per unit of power produced than large-scale systems but panels can be located using whatever space is available, including rooftops. Small-scale PV systems at EWPCF could be installed on building rooftops, such as the Solids Dryer and Power buildings. The covered aerations basins or the equalization ponds present available areas for PV installation.

Figure 2-9. Union Sanitary District Irvington Pump Station PV Project included 460 kW of installed solar PV in an emergency overflow basin

There are thousands of small-scale solar installations in North America on residential and commercial buildings, as well as at wastewater facilities such as USD Irvington Pump Station in Northern California. The small-scale solar PV alternative passes the fatal flaw filter and will be carried forward in the evaluation screening.

#### 2.9 Wind Turbines

Wind turbines can be purchased in a variety of sizes; utility-scale turbines are available in 100 kW to several MW units. Unit sizing is dependent on the quantity and quality of the available wind resources and the desired power output. Smaller turbines can produce power with slower wind speeds whereas larger turbines require greater wind speeds to turn the blades and generate electricity. For example, a 100-kW turbine can produce 3.7 kW with a wind speed of 9 miles per hour, and power output increases with wind speed. Turbine height, noise limits, impacts on bird species, and aesthetics must also be considered in turbine selection and sizing.

While wind turbine technology is well established and has many successful installations around the world, it is not geographically workable with EWA's site. Wind resources are low near the coastline and would not provide a large return on investment. A wind resource map of California is provided in Figure 2-10. In addition, a large wind turbine would not meet community requirements for aesthetics on the coastline and is, therefore, not compatible with the current site layout. The wind turbine alternative fails the fatal flaw filter on available space and will not be carried forward in the evaluation screening.

Figure 2-10. Wind Resource Map of California

## 2.10 Direct Sale to Adjacent Power Plant

This alternative is a direct sale of biogas to the nearby Encina Power Station and would include a conveyance pipeline and gas treatment. Encina Power Station is a large NG and oil-fueled electricity generating plant located a couple of miles away from the EWPCF. Cleanup requirements will depend on the fuel agreement and power plant. Untreated biogas can be used in boilers and duct burners; however, higher levels of conditioning or separation would be required for fueling the generation equipment. Example treatment plants that have sold, or are currently selling their biogas to power plants include Sacramento Regional Wastewater Treatment Plant and Hyperion Water Reclamation Plant.

Ultimately, selling biogas to a nearby power plant gets EWA the lowest value for their biogas. RINs and LCFS credits do not apply to biogas sold for power production because these credits only apply to biogas used for vehicle fuel. After reviewing EWPCF's NG bills, the market value of NG is much lower than potential value from generating electricity or producing vehicle fuel to make this option economically feasible and will not be carried forward.

## 2.11 Net Energy Metering

A net energy metering (NEM) agreement with SDG&E can be applied to any alternative that generates electricity from a renewable fuel (e.g., biogas-fueled IC engines, biogas-fueled microturbines, and solar PV). NEM would track how much grid electricity is consumed by EWPCF and how much excess electricity is renewably generated; EWPCF would only pay for the net electricity consumption. The benefits of NEM can be maximized if most power generation occurs during high demand periods and most power consumption occurs during low demand periods. NEM eliminates costly standby charges, which is a major benefit. NEM requires interconnection to the grid, and generated power would not be used directly by EWPCF.

NEM is considered an alternative that can be combined with power generation alternatives in the SWEET analysis; however, NEM is not included in the Fatal Flaw Screening and Technology Ranking that are presented in this TM. Table 2-2 lists likely electrical upgrades that would need to be implemented if going to net metering triggers the requirements for a new Rule 21 interconnection application. Attachment B includes the SDG&E Distribution Interconnection Handbook and potential electrical upgrades specific to EWPCF's system that would be required for a Rule 21 interconnection agreement. The biggest issue, both technically and from a cost perspective, appears to be that SDG&E would require real-time metering of the net generator output completely separate from the metering at the point of interconnection. Based on the plant's record drawings, the facility was not originally set up for this. The reasoning typically given for this SDG&E requirement is that the utility is managing a large, dynamic system and they need to know how much active generation output of each type they have connected to each segment of their system to manage it. The 1 MW threshold is to prevent this from being too burdensome to small (typically solar) generators.

Table 2-2. SDG&E Rule 21 Interconnection Electrical Upgrades							
Requirement	Reference	Implementation Level of Effort					
Replace Main Utility Meters with NEM Capable Meters	SDG&E Interconnection Handbook §2.1	Easy – utility swaps these into the existing meter sockets.					
Add SDG&E Metering to measure "net generator output" and "provide real-time kW and kVAR transmitted to SDG&E grid ops."	SDG&E Interconnection Handbook §2.1 and §2.2 Figure 1	Difficult - the way the plant is currently set up, this would require cutting in new utility metering at each generator (which requires physical modification, new conduits/cables,					
[Required for generating facilities >1MW. This is not metering at the point(s) of utility connection – this is the actual net output of the generation system, regardless of plant load.]		and new SCE metering cabinets).					
Provide service to SCE's telemetering equipment (high- speed data line and 120VAC UPC circuit) at location of meters for the generators.	SDG&E Interconnection Handbook §2.6	Moderate – requires routing of conduit/cables to generator area, making physical space available for SCE's telemetering equipment.					
Add visible disconnect switches for lock-out / tag-out of generation facility.	SDG&E Interconnection Handbook §3.2	Difficult if required – requires physical modification of conduits/ductbanks, re-routing of cables, and physical					
[SDG&E may allow racking out the existing breakers to meet this requirement, but this is evaluated on a case by case basis.]		location/mounting of equipment.					
Reconfigure generator controls system for continuous paralleling and export mode as opposed to load following or islanding mode.	SDG&E Interconnection Handbook §3.3	Moderate - Likely to be possible with the existing generator control system, but will require on-site time for implementation and testing by the generator control system					
Change generator control system to regulate power factor (not voltage) when connected to SCE's system (if not already implemented).		supplier.					
Modify existing main switchgear protective relays to allow sensing of ground faults on utility system (so that plant generators don't feed into it).	SDG&E Interconnection Handbook §3.3 & §3.6	Moderate - Requires main switchgear shutdown (of one side at a time) for minor internal physical modification of existing switchgear. Also reconfiguration and retesting of existing relays after new settings are approved by SDG&E.					
Witnessed "Pre-parallel testing" required for SCE signoffs.	SDG&E Interconnection Handbook §6.3	Thorough on-site testing of switchgear protective relays, generator control system, and metering interface. Usually multiple days with several different suppliers, an independent testing firm, and the utility's representative on site.					
SCE System Upgrades (transfer trip, reclose blocking, etc.) – items that SCE will have to upgrade on their side of the system.	SDG&E Interconnection Handbook §3.6	Little activity on the EWA side – this is more of a project cost issue.					
[Dependent on the overall conditions of the SCE circuit being connected to and other customers - cannot be known or obtained from SCE until an application is submitted and SCE performs an engineering study.]							

### 2.12 Fatal Flaw Conclusions

The results of the fatal flaw screening evaluation performed in this section are presented in Table 2-. Alternatives that passed the fatal flaw filter will each be evaluated and scored in Section 3 to determine which alternatives will be analyzed using BC's SWEET tool.

Table 2-3. Power Production Technology Screening: Fatal Flaw Evaluation								
	Technology Maturity	Successful Operation	Available Space	Compatibility				
Internal Combustion Engines	Pass	Pass	Pass	Pass				
Digester Upgrading: Pipeline Injection	Pass	Pass	Pass	Pass				
Digester Upgrading: Vehicle Fueling (CNG)	Pass	Pass	Pass	Pass				
Microturbines	Pass	Pass	Pass	Pass				
Biosolids Drying - Direct Use of Biogas	Pass	Pass	Pass	Pass				
Energy Storage	Pass	Pass	Pass	Pass				
Fuel Cells	Fail	Fail	Pass	Pass				
Wind Turbines	Pass	Pass	Fail	Fail				
Small Scale/Rooftop Solar Photovoltaics	Pass	Pass	Pass	Pass				
Large Scale Solar Photovoltaics	Pass	Pass	Pass	Pass				
Direct Sale to Adjacent Power Plant	Pass	Pass	Pass	Fail				

Ultimately, the IC engines, biogas upgrading, microturbines, biosolids drying, energy storage, and solar PV alternatives passed the fatal flaw filter and will be reviewed further in the technology screening evaluation (presented in Section 3).

## **Section 3: Ranking of Screened Technologies**

This section describes the results of applying the evaluation criteria described in Section 2 to further screen and rank the technologies that passed the fatal flaw filter.

#### 3.1 Introduction

Technologies that passed the fatal flaw filter were evaluated using a weighted scoring matrix. The final scores and weights were fixed in Workshop 2 with EWA staff. In this analysis, a weighted average score of 3 or less led a technology to be eliminated from further consideration. The rationale behind the scoring for each technology area is described in this section.

## 3.2 Criteria Descriptions and Weightings

Alternatives that passed the fatal flaw filter were further evaluated and ranked based on both economic and non-economic screening criteria. The BC team worked with EWA staff to develop a series of evaluation criteria that reflect the project goals, EWA's values, and EWA's general operational practices. Criteria weights were assigned in Workshop 2 with EWA staff. Criteria and weightings are presented in Table 3-1.

	Table 3-1. Criteria and Weight for Technology Screening						
Criterion	Description	Scoring Description	Weight				
Proven Technology Performance	Proven and reliable technology with same configuration intended at Encina.  Long successful operating track record.	Low score indicates no successful large scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.  High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration > 5 years, and vendors in western USA.	20%				
Minimize Life-Cycle Costs	Qualitative metric of program cost.  Capital and O&M costs based on existing EWA data or similar experience at other WWTPs.  Potential revenues from sales.	Low score indicates high capital cost to build onsite facilities, high 0&M costs, and low energy recovery efficiency.  High score indicates low capital cost to build onsite facilities, low 0&M costs, and potential revenue.	10%				
Energy/Resource Recovery	Recovery of renewable energy.	Low score indicates high energy requirement for onsite technology, technology does not recover, and low efficiency recovery of renewable energy.  High score indicates a higher electrical efficiency.	25%				
O&M Impacts	Impacts to existing plant O&M staff levels.  Complexity of new technology O&M and control systems.  Reliability of new technology (potential downtime).  Minimal impacts to plant safety.	Low score indicates more O&M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and newer hazards.  High score indicates reduction in O&M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new hazards.	10%				
Environmental Impacts	Impacts to carbon footprint and air permitting.	Low score indicates high carbon footprint for technology, and new permitting for environmental regulatory requirements.  High score indicates low carbon footprint for technology, reduced pollutant emissions, no additional permitting for environmental regulatory requirements.	15%				
Community & Stakeholder Impacts	Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.  Assess impacts to partner agency issues/values as well as local planning codes and requirements.	Low score indicates nuisance factors for on-site technology are difficult to mitigate.  High score indicates nuisance factors can be mitigated at plant site.	10%				
Project Site Compatibility	Assess compatibility of technology with available plant footprint. Incorporation into existing treatment process.	Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant.  High score indicates available footprint for new facilities and maintains space for future facilities, ease of integration with existing processes and facilities.	10%				

#### 3.3 Results and Discussion

Table 3-2 shows the scoring results for the alternative power production technologies that passed the fatal flaw filter. Among these, small-scale rooftop PV, IC engines with gas conditioning, IC engines with selective catalytic reduction (SCR), and biogas upgrading to vehicle fuel scored the highest. Rationale behind the scoring for each technology area is described below.

Table 3-2. Alternatives Scoring Evaluation										
	IC Engines - Status Quo	IC Engines - with Gas Conditioning	IC Engines - with Exhaust Treatment	Biogas Upgrading: Pipeline Injection	Biogas Upgrading: Vehicle Fueling (CNG)	Microturbines	Biosolids Drying	Energy Storage (Batteries)	Small-Scale Rooftop PV	Large-Scale PV
Proven Technology Performance	5	5	4	2	3	4	5	3	5	5
Minimize Life-Cycle Costs	3	3	4	4	4	3	3	3	4	4
Energy/Resource Recovery	4	4	5	4	4	4	2	1	5	5
O&M Impacts	3	4	3	4	4	4	3	4	5	5
Environmental Impacts	3	3	4	5	5	5	3	3	5	4
Community & Stakeholder Impacts	4	4	5	5	5	4	3	3	5	5
Project Site Compatibility	5	5	4	4	4	4	5	3	2	2
Weighted Score	3.95	4.05	4.25	3.85	4.05	4.05	3.35	2.60	4.60	4.45

#### 3.3.1 Internal Combustion Engines

IC engines received the highest score for proven technology performance and project site compatibility since they are already in operation at the plant. Gas conditioning of biogas is a common practice for many treatment plants and does not require a significant footprint. In Workshop 3, plant staff agreed that gas conditioning equipment could be located on the empty space near the digesters and existing gas blowers. Exhaust treatment, particularly SCR, is proven on natural-gas-fueled engines, but has only recently been required for biogas facilities. The addition of SCR to biogas engines is driven by air permit standards in the state's most restrictive air districts, such as the South Coast and Bay Area. Robust biogas conditioning is required to protect the SCR catalyst. Few WWTPs operate engines with SCR; however, this technology is deemed feasible and "best available" in several districts. Orange County Sanitation District recently added SCR to their central generation facility to meet permit requirements. Figure 3-1 shows a site layout for potential implementation of gas conditioning and SCR gas treatment.

Figure 3-1. Site layout for IC engines with gas treatment technologies

Adding exhaust treatment to eliminate the permit restriction, thus allowing the plant to run more engines, would increase energy recovery and lower annual electricity costs. EWA staff are familiar with IC engines; i.e., there is no added complexity for this alternative. Adding gas conditioning reduces O&M effort on the engines, but introduces O&M required for the conditioning system. Exhaust treatment such as an oxidation catalyst and/or SCR will add a layer of complexity, especially for handling materials such as urea reactant and O&M and reporting for the continuous emission monitoring system.

Engines produce particulate matter, carbon monoxide (CO), sulfur oxide, and NOx emissions without exhaust treatment. With exhaust treatment, CO and NOx emissions are reduced and have less of an environmental impact.

#### 3.3.2 Biogas Upgrading

Biogas upgrading is still considered an emerging technology and has fewer large-scale installations and less established equipment manufacturers. There are more installations of on-site vehicle fueling in California that have been in successful operation in comparison to pipeline injection; therefore, vehicle fueling scored a 3 and pipeline injection scored a 2. Example projects for pipeline injection are limited to California projects due to more stringent standards compared to other states.

Biogas upgrading alternatives can bring in potential revenue from LCFS and RINs credits generated for producing renewable fuel, currently valued between \$1 and \$2 per diesel equivalent produced (1440 cubic feet of biogas produces approximately 5 diesel gallon equivalents of fuel) in addition to the value of the fuel itself. However, they have a relatively high capital cost, thus, lowering the life-cycle cost score to a 4.

Generally speaking, the electricity grid is more renewable than the NG grid in California; therefore, decreasing the amount of purchased NG has a greater environmental benefit compared to reducing purchased electricity. However, depending on how much NG is purchased for running cogeneration engines or running a boiler as part of an overall biogas upgrading operation, this alternative may end up being more equivalent to the other options.

Figure 3-2 shows where the biogas upgrading for pipeline injection could be located at the plant and Figure 3-3 shows the alternative with on-site vehicle fueling.

Figure 3-2. Potential siting of biogas upgrading equipment at EWPCF

Figure 3-3. Potential siting of biogas upgrading and on-site vehicle fueling equipment at EWPCF

#### 3.3.3 Microturbines

With proper biogas treatment, microturbines are a proven combined heat and power technology that is utilized at several treatment plants. While not as common as IC engines, microturbines are still a proven technology and more treatment plants, such as San Francisco Southeast Plant and Roseville Pleasant Grove WWTP, will be installing them. In addition, microturbines have very low emissions, are California Air Resources Board-certified and easy to permit; therefore, they have favorable environmental impacts.

Microturbines have a slightly lower capital cost than IC engines, similar 0&M costs, but 20 to 25 percent less electrical energy recovery than IC engines; therefore, microturbines do not offset as much electrical costs. Life-cycle costs are similar to that of an engine; consequently, microturbines received a 3 in life-cycle costs.

Microturbines are packaged in a modular enclosure and can be easily removed from the system for routine maintenance. By installing multiple smaller capacity units, maintenance can be performed simultaneously to minimize downtime. Microturbines have few moving parts and have demonstrated high reliability when installed with proper gas treatment.

Microturbines are relatively quiet devices with a published sound level of 65 A-weighted decibels at 10 meters and would not impact neighbors. There are no odors or traffic associated with microturbines. Additionally, microturbines are pre-packaged within an enclosure and are low profile, therefore, would not impact the visual quality of the plant.

Figure 3-4 shows a site map with potential location of a microturbine project with gas conditioning included. Microturbines have a compact footprint and come shipped as containerized units, making it easy to accommodate them on the site.

Figure 3-4. Site layout of microturbine project with gas conditioning

#### 3.3.4 Biosolids Drying

Biosolids drying received the highest score for proven technology performance and project site compatibility since this process is already in operation at the plant. However, with respect to energy recovery, using biogas in the biosolids dryer is the lowest financial value of biogas. There are no financial incentives available when biogas is used in the solids dryer, aside from offsetting NG use. Using biogas as a replacement for NG also introduces volatile organic compounds that must be treated in a regenerative thermal oxidizer.

#### 3.3.5 Energy Storage

Energy storage via batteries is a proven technology, but have only recently been installed on a larger scale at treatment plants. Energy storage does not provide any resource recovery of biogas or generate any additional power — batteries strictly provide storage to lower non-coincident demand costs through energy arbitrage. Battery storage will not be carried forward to the SWEET analysis since it did not achieve an overall score greater than 3. Battery storage and microgrid controls may be reevaluated as a means to stabilize engine operation and performance when disconnected from the grid.

#### 3.3.6 Solar PV

Solar PV options require minimal effort from O&M staff to operate and have a moderate capital cost. They scored the highest in energy and resource recovery because they utilize power from the sun and still allow for biogas to be used in the engine or solids dryer. There are no emissions from solar panels; therefore, they have minimal environmental impacts.

With respect to site capability, small-scale solar would be challenging to locate since the panels would need to be located on multiple buildings and locating them on the primaries or secondaries may be a corrosive, hazardous space that reduces access to the tanks. Input from EWA staff recommended putting small-scale solar (if used) on the aeration basins, which is the location highlighted in Figure 3-5. For large-scale solar, the large open area south of the EWPCF site was identified as a potential location. However, small or large-scale solar likely isn't required at the plant since 80 percent of the power demand is generated by the engines, leaving a relatively small amount of electricity usage charges that could be offset. Large-scale solar is most applicable if biogas is upgraded instead of used for power production – this leaves more available electricity consumption for offset. Large-scale solar options may be combined with net metering or energy storage to accommodate the excess power production. Figure 3-5 shows potential locations for solar PV panels at the plant.

Figure 3-5. Potential siting for solar PV panels at EWPCF

## **Section 4: Conclusions and Next Steps**

Screening of alternative power production resulted in a final selection of technologies to be included in end-to-end alternatives and are summarized in the list below. These technologies will be combined with the results of Tasks 2, 4, and 5 for the creation of end-to-end alternatives for analysis in the SWEET model. Factors influencing power production, such as gas treatment and codigestion (TM 4), will be paired with the power production technologies to aid in selection of the best overall alternative. Development of end-to-end alternatives will be performed in cooperation with EWA staff prior to analysis.

A shortlist of alternatives to be carried forward in SWEET analysis follows:

- Continued use of the existing IC engines
  - With gas conditioning
  - With gas conditioning plus SCR
- Biogas upgrading
  - Pipeline injection
  - On-site vehicle fueling
- Microturbines
- Biosolids drying direct use of biogas
- Large-scale solar PV
- Small-scale/rooftop solar PV

## **Attachment A: Workshop Meeting Minutes**

August 16, 2017

## Meeting Minutes

9665 Chesapeake Drive, Suite 201 San Diego, CA 92123

T: 858.571.8822 F: 858.571.8833

Prepared for: Encina Wastewater Authority

Project Title: Energy & Emissions Strategic Plan & Biosolids Management Plan Update

**Project No.:** 150871

Purpose of Meeting: Workshop #2 Date: August 16, 2017

Meeting Location: Encina Wastewater Authority Time: 1:30 – 5:00 PM

Minutes Prepared by: Hari Seshan and Jocelyn Lu, Brown and Caldwell

Attendees: Doug Campbell, Encina, JPA Adam Ross, Brown and Caldwell

Scott McClelland, Encina JPA

Jimmy Kearns, Encina JPA

Mike Steinlicht, Encina JPA

Octavio Navarrete, Encina JPA

Natalie Sierra, Brown and Caldwell

Scott Lacy, Brown and Caldwell

Nathan Chase, RMC

Tom Chapman, Brown and Caldwell

#### Attachments:

Workshop #2 Presentation Slides

#### **Decisions**

The following is a list of decisions made as a result of the meeting discussion:

- BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.
- Stabilization technologies that moved to the next round of evaluation: Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.
- Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Presses.
- Post-dewatering technology that moved to the next round of evaluation: Thermal Drying -High Quality (Drum Dryer).
- Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines with Gas Conditioning, Internal Combustion Engines with Exhaust Treatment, Digester Upgrading Pipeline Injection, Micro-Turbines, Biosolids Drying Direct Use of Biogas, Large Scale Photovoltaics (PV), Small Scale Rooftop PV.
- Waste heat technologies that moved to the next round of evaluation: Small-Scale Steam Turbines, and Thermo/THP.

#### **Action Required**

The following is a list of actions required as a result of the meeting discussion:

- Jimmy to send Adam maintenance schedule costs.
- Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.
- Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments.
- Octavio to send EWA's SDG&E point of contact to Adam. EWA and BC to discuss initial contact with SDG&E regarding biomethane pipeline injection.
- Octavio to send Hari lab data on the performance of the centrifuges.
- Tom to work with Octavio on refining the solids mass balance.
- Adam to present a big picture view of the power production alternatives at the next workshop.
- BC to identify technologies that would be beneficial to visit at WEFTEC.
- BC will set up a meeting with Anaergia to discuss project goals and opportunities. This meeting will be separate from the Waste Hauler meeting.
- Scott L and Scott M will schedule Workshop 3 for mid-September aim for conducting the Waste Hauler meeting on the same day.
- EWA will take the dryer out of service in September/October. BC requests that any condition assessment results be shared with the team particularly related to the increased use of digester gas (siloxane or hydrogen sulfide issues).
- BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

#### **Summary**

Workshop #2 was held for the Encina Water Authority (EWA) Energy & Emissions Strategic Plan & Biosolids Management Plan Update. The purpose of this Workshop was to review pending administrative tasks and provide task updates. A summary of the discussion is provided below:

#### Introductory Items

BC started off the meeting by reviewing the schedule and goals for the meeting. The goals are to generate content and direction for the project team moving forward.

- This month, the Brown and Caldwell (BC) team will be:
  - Preparing a baseline report, to be reviewed by EWA in September.
  - o BC will also be preparing report sections of Tasks 2 and 3 by September.
  - In October and November, BC will be developing SWEET alternatives and providing more clarity on how the pieces interact.
- Adam Ross (Adam) stated that he expects to have more questions about permitting, cogeneration (cogen), electrical rates, and where to send digester gas, and would appreciate dialogue between now and the next workshop. EWA staff recommended for him to work with Octavio Navarrete (Octavio).

#### **New Data Request Items**

BC reviewed new data request items with EWA. They included:

• Trussell food waste capacity report - Scott McClelland (Scott M) stated that he has the data, but not the report, on the Trussell study. Preliminary conclusions of the report indicate that EWA could accept an additional 80,000 gal/week of FOG and 25,000 gal/week of brewery waste. EWA expect it'll take about another month before the report is ready. Imported wastes are received Monday – Friday/Saturday. A constant feed to the digesters is provided until around Saturday afternoon. A potential limitation to high strength waste acceptance is truck offloading capacity. A food waste pilot program began on Monday, 9/14.

- O&M costs for cogen engines Adam asks if EWA has annual O&M costs for the engines. Jimmy Kearns (Jimmy) states that EWA has annual costs for the maintenance schedule.
  - ACTION: Jimmy to send Adam maintenance schedule costs.
- WAS flow data
  - BC requests the WAS flow data, and Octavio indicates that EWA does have that data.
  - o ACTION: Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Air permitting summaries or progress
  - o Doug Campbell (Doug) sent Adam the latest email from Don King (Don).

#### **Outstanding Data Requests**

BC reviewed outstanding data requests with EWA. They included:

- Cogen drawing and cut-sheets
  - o Natalie Sierra (Natalie) points out that BC has received drawings from Andritz.
- Information on energy management
- High strength waste storage (typical day operating procedure)
- ACTION: Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.

There was a subsequent discussion on wasted gas that was being flared. Octavio explains that the operators need to manually control the digester gas flow to the dryer, which results in some flaring. Operators generally try to set the digester gas flow rate to avoid drawing down the gas system and triggering natural gas blending at cogen. This typically results in a conservative offtake of digester gas to the dryer which results in some flaring. Mike Steinlicht (Mike) asks how much is being flared, and Adam calculated that about 180 kW of gas was being flared (averaged over a month) in current operation.

Cogeneration operation was discussed. EWA operates two engines on digester gas 24/7. A third engine operates on natural gas during peak power rates. EWA physically disconnects from the power grid to avoid demand and consumption charges.

FOG is fed to the digesters at a constant rate of 12 gallons per minute. FOG is fed to only one or two digesters, not all. The FOG feeding begins on Monday with first deliveries of the week, and continues into Saturday to pump down material from the last deliveries on Friday.

#### **Meeting with Waste Haulers**

BC reviewed the timing, attendees, and goals of the Waste Haulers Meeting. Below is a summary of the discussion:

- Scott L reviewed the potential list of attendees, which included: EWA representatives, BC representatives, Waste Management (WM), Republic, EDCO, and potentially LES or Anaergia.
  - ACTION: Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Scott M stated that the intent of the meeting is to develop a public-private partnership and noted increase grant eligibility by having this kind of relationship.
- Mike emphasized that the elected officials want all of the waste haulers at the table, especially those that operate within EWA's service area.
- Adam reviewed the draft Waste Hauler Agenda, which would cover background on the plant, current operation, and a discussion of potential capacity.
- Scott M stated that he would like to have an agenda finalized and sent out to each waste hauler 30 days in advance of the meeting, to give them adequate prep time.
  - ACTION: Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments 30-days in advance of the meeting.
- Adam stated that another discussion point for the meeting is the waste haulers potential interest in accepting compressed natural gas (CNG). Scott M stated that SDG&E should be involved in these conversations as well. A meeting should be arranged with SDG&E.
  - o ACTION: Octavio to send EWA's SDG&E point of contact to Adam.
- Different gas delivery options, tube trailer vs. pipeline, were discussed. Adam stated that a
  tube trailer has less stringent standards than a pipeline, but there would be tube trucks coming in and out of the facility. However, the pipeline would have more stringent sampling/reporting requirements and the investment for an interconnection for the pipeline could cost
  \$1 2 million dollars. This will be developed as the alternatives analysis is advanced.

#### Other Outstanding Items

BC reviewed their understanding of the discussion with Anaergia:

Adam stated that Anaergia is promoting Omnivore as a process treatment option, which may
or may not be the right fit at EWA. However, there might be opportunity for Anaergia to work
with waste haulers for pre-processing food waste.

#### Review of Mass Balance and Project Flows and Loads

BC presented the project flows and loads:

- Mass Balance
  - Hari reviewed the assumptions made to calculated WAS. Octavio responded that the actual WAS flow is around 0.75 MGD, and that he could send that data to BC (ACTION above).
  - Adam stated that the VSR value of 65% seemed suspiciously high. Octavio stated that EWA's VSR value was closer to 55%.
  - Hari stated that the centrifuge % capture right now is 78%. Octavio responded that
    the capture rate for the centrifuges is consistently 95%, and that the calculated value
    is probably lower because of values during start-up and shut-down.
    - ACTION: Octavio to send Hari lab data on the performance of the centrifuges.

o Tom requested that the BC team review the data with Octavio after he send is to BC.

- ACTION: Tom to send up conference call with Octavio after reviewing the data.
- Solids Mass Balance Comparison
  - Tom presented a graph that shows that BC's calculated solids loading was higher than the calculated values in the Process Master Plan (2016).
  - Octavio stated that one reason for the increase might be a 2015 change in how EWA sampled the influent flow.
  - o ACTION: Tom to work with Octavio on refining the solids mass balance.
- Power Loads and Gas Usage
  - Adam reviewed the gas usage graphs with EWA.
  - Digester Gas Usage Summary Total gas production is trending up, probably due to the increase in high strength waste deliveries. Adam pointed out that the yellow "Total Gas Production" line didn't match up with the top of the bars, which is normal. Scott M pointed out that the important part is that the yellow line followed the same trend as the bars.
  - Natural Gas Usage Summary Most of the natural gas is being used for the heat dryer and cogen, which is expected.
  - Power Production and Import Currently, EWA is making about 80% of their electricity needs. This means that EWA could potentially export power. A look into the SDG&E power bills also showed that the actual kWh power that EWA is purchasing only constitutes \$10,000 out of a \$70,000 bill. The majority of the bill is non-coincident and standby power.
    - Mike stated that he had talked to SDG&E about the standby charges and haven't been able to get around them.
- Engine Fuel Use
  - Octavio explained that the increase in natural gas in November 2015 was because they needed to switch to natural gas to stay below emission limits.

#### Screening of Technologies

BC the fatal flaw filter and evaluation criteria, and then evaluated each process technology against that criteria. The results of the evaluation are summarized below and more details are included in the attached Workshop #2 PowerPoint slides.

- There were four fatal flaw filters:
  - o At least one successful North American installation of the technology
  - At least one successful installation in a facility of similar size
  - There is available space to implement that technology
  - Compatibility with plant size and any existing equipment
- The technologies that passed the fatal flaw filter were then scored for each evaluation criteria, which included: end use market compatibility, proven technology performance, life cycle costs, energy/resource recovery, O&M impacts, environmental impacts, community and stakeholder impacts, and project site combability.
  - Each evaluation criteria was then weighted to reflect EWA's priorities.

 Technologies that scored lower than a 3 were eliminated, and technologies that scored greater than a 3 would be evaluated through the SWEET model.

O&M impacts criteria will be clarified to describe reduction in O&M staff time.

#### Thickening Technologies

- Prior planning efforts recommended evaluating rotary drum thickeners (RDTs)
  against the existing primary clarifier and dissolved air flotation thickeners (DAFTs).
  EWA concurred with that recommendation.
- Natalie asked if the team should add Anaergia's Omnivore to the list of technologies to evaluate. Scott L proposed that that decision to be made after a meeting with Anaergia takes place.
  - DECISION: BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.

#### Stabilization Technologies

- Technologies that failed the fatal filter: Staged Digestion, Acid/Gas Phased Digestion, Temperature Phased Anaerobic Digesion, Enzymatic Hydrolysis, Chemical Hydrolysis, THP – DLD. and Solid Stream CAMBI.
- o Technologies that scored lower than a 3 in the evaluation criteria: Lystek.
- (DECISION) Stabilization technologies that moved to the next round of evaluation:
   Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.

#### Dewatering Technologies

- o Technologies that failed the fatal filter: Bucher Press.
- Technologies that scored lower than a 3 in the evaluation criteria: Screw Press, Rotary Press, and Volute Press.
- (DECISION) Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Press.
- Post-Dewatering Technologies
  - Technologies that failed the fatal filter: Thermal Drying: Low Quality (Indirect Dryer),
     Gasification, and Pyrolysis.
  - o Technologies that scored lower than a 3 in the evaluation criteria: N/A
  - (DECISION) Post-dewatering technologies that moved to the next round of evaluation:
     Thermal Drying: High Quality (Drum Dryer).
- Alternative Power Production Technologies
  - Technologies that failed the fatal filter: Fuel Cells and Wind Turbines.
  - Technologies that scored lower than a 3 in the evaluation criteria: Energy Storage (Batteries), Large Scale Solar Photovoltaics
  - (DECISION) Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines – with Gas Conditioning, Internal Combustion Engines – with Exhaust Treatment, Digester Upgrading – Pipeline Injection, Micro-Turbines, Biosolids Drying – Direct Use of Biogas, Large-Scale Solar Photovoltaics (PV), and Small Scale Rooftop PV.
- Waste Heat Technologies
  - Technologies that failed the fatal filter: Absorption and Adsorption Chillers, Organic Rankine Cycle, and Gasification of Biosolids.

- Technologies that scored lower than a 3 in the evaluation criteria: N/A
- (DECISION) Waste heat technologies that moved to the next round of evaluation:
   Small-Scale Steam Turbines, and Thermo/THP.

#### Creation of End to End Alternatives

The BC team reviewed initial alternatives that were to be evaluated, as well as different power production alternatives. The power production alternatives included:

- · Baseline: existing cogen and drying
- · Baseline with gas conditioning
- Existing cogen with vehicle fuel (via pipeline injection or tube trailer)
- Existing cogen with microtubines
- Existing cogen with steam boiler/turbine
- New cogen permit, CO catalyst and selective catalytic reduction (SCR), with gas conditioning
- · Vehicle fuel (primary use of digestive gas) with existing cogen
- ACTION: Adam to present a big picture view of the power production alternatives at the next workshop.

#### **Grant Updates**

BC provided an overview of different grant programs, and explained how the program would fit into the SWEET model. The programs included:

- Self-Generation Incentives Program
- Low Carbon Fuel Standard
- Renewable Fuel Standard
- Organics Grant Program
- · Healthy Soils Program
- Green Project Reserve

#### **Air Permitting Discussion**

BC and EWA discussed the current efforts of the air permit modification. EWA is submitting a request for permit modification in one week. If successful, it would increase the permitted cogen capacity by  $\sim 20\%$ .

#### Look Ahead & Wrap-Up

The meeting ended with a look ahead and reviewing pending action items.

- Workshop #3 will take place in mid-September, and the team will try to schedule the Waste Hauler Meeting on the same day.
- The team will present the following in Workshop #3:
  - o Baseline SWEET model
  - o Conceptual layouts and details of alternatives for consensus and feedback
  - Air permitting impacts on power production alternatives
  - Grant updates
- WEFTEC is also taking place in early-October. Mike stated that it would be beneficial to walk the floor together with BC to look at potential technologies.
  - ACTION: BC to identify technologies that would be beneficial to visit at WEFTEC.

• ACTION: BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

**Energy & Emissions Strategic Plan & Biosolids Management Plan Update** 

# Workshop #2 – August 16, 2017

**Encina Water Pollution Control Facility** 

# **Project Schedule**

- Progress On Schedule
- Task 1 Energy Baseline Complete
- Strategic Plan & Strategic Plan Update Other Tasks (except 7) are Under Way
- Workshop #2 Today

# Agenda

- Administrative (20 min)
  - Status of data requests
  - Comments on waste hauler agenda
  - Discussion with Anaergia
- Review Mass Balance and Projected Flows and Loads (45 min)
- Review Fatal Flaw and Screening Criteria (30 min)
- Screen Technologies (1 hr)
- Discussion of Preliminary End to End Alternatives (30 minutes)
- Grants Update (10 min)
- Air Emissions Review (5 min)
- Wrap-Up/Review Action Items (10 min)

# **New Data Requests**

- Trussell food waste capacity report
- O+M costs for the engines (have costs for electricity for the system, but not for gas treatment, upkeep, general maintenance, etc.)
- WAS daily flow data (back-calculated for mass balance)
- FOG TS and VS data (used assumptions from 2016 PMP for mass balance)
- Any air permitting summaries or progress between EWA and Don King

## **Outstanding Data Requests**

- Cogen and solids systems drawings, engine cut sheets
- Dryer system drawings and cut sheets
- Recent air permitting efforts progress, memos, contact info
- Copies of current air permits (SDAPCD and Title V)
- Energy Management typical day operating procedure:
  - Cogen strategy
  - Peak period disconnect from utility
  - HSW storage and feed strategy

# Waste Hauler Agenda

- Timing: September (coordinate with Workshop 3)
- Attendees:
  - EWA Scott, Jimmy
  - BC Adam, Ari
  - WM
  - Republic
  - EDCO
  - LES?
  - Anaergia?
- Goals:
  - Provide background info to haulers about EWA's goals and BEE effort
  - Determine availability of pre-processed food waste, market demand for an EWA initiative to receive more material, tipping fee range for SWEET analysis
  - Gauge interest in a renewable CNG partnership
  - Discuss "next steps" such as letter of intent, future coordination

# Other Outstanding Items

- Discussion with Anaergia
  - Omnivore as an alternative
  - Orex or Biorex for food waste pre-processing
  - and Caldwell Brown and Caldwell Prepared by Brown Status of food waste receiving project(s) with Republic
  - Capacity at Rialto facility for dried product?

# Review of Mass Balance and Projected Flows and Loads

## **Mass Balance**

#### **MAY 2015 - JUNE 2017**

9

## **Mass Balance Assumptions**

- TWAS flows that were zero and subsequent loads when TWAS flow was zero were excluded. Assumed percent capture rate for the DAFTs is 95%.
- TWAS flows were taken from DAFT totalizer data and digester feed meters.
- The digester feed flow from July 1, 2016 to June 2017 were subtracted daily to obtain a daily digester feed volume. This was based on the assumption that the flow values were cumulative from a meter reading starting 7/1/16.
- The Class B cake data were averaged with zero data to obtain an annualized daily average.
- FOG data were a daily average of the volumes received. This assumes FOG is fed 24/7/365. Assumes %TS and %VS are 5% and 82%, respectively.
- To calibrate the mass balance as shown, 2,300 lbs TS/d and 1,900 lbs VS/d were added to Primary Sludge.

## **Solids Mass Balance Comparison**

# Sludge Production Peaking Factors

	Max Month	Peak 2-Week	Peak Week	Peak Day
Primary Sludge	1.23	1.3	1.4	1.60
WAS	1.23	1.3	1.4	1.60
Combined Sludge	1.23	1.3	1.4	1.60

#### Notes:

- Peaking factors for maximum month and peak day conditions are developed based on 2016 PMP solids projections.
- Peaking factors for maximum 2-week and maximum week conditions are proposed based on historical data.

#### **Power Loads and Gas Usage**

- Power:
  - Monthly production: 1,500 kW (2, 750 kW engines full output)
    - 80% of total electrical demand)
  - Monthly import: 385 kW equivalent (1,390 MWh per year)
- Digester gas:
  - Average production: 1,645,000 therms per year Caldwell
  - Engines: 1,263,000 therms per year
  - Waste gas: 229,000 therms per year
  - Heat dryer: 57,000 therms per year
- Natural gas: 856,000 therms per year
  - Engines: 156,000 therms/year
  - Other plant use: 700,000 therms/year

#### Digester Gas Usage Summary - Last 2 years

- 1) What happened November 2015? DG outage?
- 2) Divergence of "total gas production" from sum of other meters
- 3) When DG is sent to the heat dryer, what contributes to flaring?
- 4) Flared gas, over the course of the last year, represents 179 kW of "potential" power production

#### Natural Gas Usage Summary – Last 2 years

1) What is the NG control strategy to cogen? Why is there NG contribution to cogen in months where DG is being sent to dryer or flare?

#### Power Production and Import – Last 2 years

- 1) Consistently operating at 2-engine output
- 2) Operating a third engine at full output (if DG production increases and/or permit is modified) would result in power export

#### **Engine Fuel Use-Last 2 years**

- 1) Consistent operation
- 2) What is NG blending strategy?

## **Screening of Technologies**

#### **Fatal Flaw Filter**

- Applied uniformly across all technologies
- Four criteria:
  - At least one successful North American installation of technology
  - At least one successful installation in a facility of similar size
  - Available space
  - Compatibility with plant size and any existing equipment

#### **Evaluation Criteria**

Criterion	Criterion Description	Scoring Description
End Use Market Compatibility	<ul> <li>Onsite technology directly produces one of the recommended product alternatives.</li> <li>Alternately, onsite technology product is compatible with product alternatives.</li> </ul>	<ul> <li>Low score indicates technology product that has not been identified as part of the product list nor compatible with the product list.</li> <li>High score indicates technology product that is compatible with Class B cake, Class A cake, Class A THP cake, and dried Class A pellet.</li> </ul>
Proven Technology Performance	<ul> <li>Proven and reliable technology with same configuration intended at Encina.</li> <li>Long successful operating track record.</li> </ul>	<ul> <li>Low score indicates no successful large scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.</li> <li>High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration &gt; 5 years, and vendors in Western USA.</li> </ul>
Minimize Life Cycle Costs	<ul> <li>Qualitative metric of program cost.</li> <li>Capital and O&amp;M costs based on existing Encina data or similar experience at other WWTPs.</li> <li>Potential revenues from sales.</li> <li>Product/market geographic proximity.</li> </ul>	<ul> <li>Low score indicates high capital cost to build onsite facilities, high O&amp;M costs, expensive end use market, and high transportation costs.</li> <li>High score indicates low capital cost to build onsite facilities, low O&amp;M costs, potential product revenue, and product destination within 100 miles.</li> </ul>

#### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Energy/Resource Recovery	<ul> <li>Increases biogas production through advanced digestion.</li> <li>Supports co-digestion of organic waste.</li> <li>Recovery of renewable energy.</li> <li>Beneficial use of biosolids product.</li> </ul>	<ul> <li>Low score indicates high energy requirement for onsite technology, no increase in biogas production, technology does not recover energy as biogas, no recovery of renewable energy in biosolids, and no biosolids resource recovery.</li> <li>High score indicates a higher biogas production, compatible with co-digestion of organic waste, and biosolids resource recovery.</li> </ul>
O&M Impacts	<ul> <li>Impacts to existing plant O&amp;M staff levels.</li> <li>Complexity of new technology O&amp;M and control systems.</li> <li>Reliability of new technology (potential downtime).</li> <li>Minimal impacts to plant safety.</li> </ul>	<ul> <li>Low score indicates more O&amp;M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and new chemicals or hazards.</li> <li>High score indicates reduction in O&amp;M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new chemicals or hazards.</li> </ul>
	Minimal impacts to plant safety.	

### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Environmental Impacts	Impacts to carbon footprint and air permitting.	<ul> <li>Low score indicates high carbon footprint for technology, high travel distance to end use, difficult to treat side-streams or impacts to GWRS, and new permitting for environmental regulatory requirements.</li> <li>High score indicates low carbon footprint for technology, low travel distance to end use, minimal side-stream generation or impacts, no additional permitting for environmental regulatory requirements.</li> </ul>
Community & Stakeholder	<ul> <li>Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.</li> <li>Assess impacts to partner agency issues/values as well as local planning codes and requirements.</li> </ul>	<ul> <li>Low score indicates nuisance factors for onsite technology are difficult to mitigate.</li> <li>High score indicates nuisance factors can be mitigated at plant site.</li> </ul>
Project Site Compatibility	<ul> <li>Assess compatibility of technology with available plant footprint.</li> <li>Incorporation into existing treatment process.</li> <li>Ability to accept co-digestion substrates.</li> </ul>	<ul> <li>Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant.</li> <li>High score indicates available footprint for new facilities and maintains space for future facilities, easy of integration with existing processes and facilities.</li> </ul>

#### **Evaluation Criteria Weighting**

Criterion	Weight Stabilization	Weight Dewatering	Weight Biogas Use and Waste Heat
End Use Market Compatibility	15%	15%	NA
Proven Technology Performance	15%	25%	20%
Minimize Life Cycle Costs	10%	20%	10%
Energy/Resource Recovery	20%	NA	25%
O&M Impacts	10%	15%	10%
Environmental Impacts	10%	5%	15%
Community & Stakeholder Impacts	10%	5%	10%
Project Site Compatibility	10%	15%	10%

#### Thickening Technologies

- Primary Clarifier (Existing)

- Rotary Drum Thickener (RDT)
   Recommendation from prior plans:
  evaluate PDTstatus quo
  Workshop and Caldwell
  Prepared by Brown evaluate RDTs compared to status quo

# Starting with the End in Mind – Market Compatibility

- Class B Cake Land application (Arizona) or contract composting
- Class A Cake Land application in CA and AZ (soil blending and land reclamation possible)
- Class A THP Cake Land application and soil blending (land reclamation possible)
- Class A granules (high quality) Land application, horticulture, fertilizer blending, soil blending (land reclamation possible)
- Class A granules (low quality) Land application (land reclamation possible)
- Class A Lystegro Land application

#### Options to produce end-use product alternatives

Product Alternatives	Technology Options
Class B Cake	Class B digestion
Class A Cake	Class A digestion (thermophilic or TPAD)
Class A THP Cake	THP/digestion
Class A Dried Granule (high quality)	Class A or B digestion + two dryer trains
Class A Dried Granule (low quality)	Class A or B digestion + maximize existing dryer
Class A Lystegro	Class A or B digestion + Lystek
Class A Lystegro  Prepared by Bro	

#### Stabilization Technologies

- Mesophilic Digestion

- .Ju/ Gas Digestion

   Thermophilic Digestion

   Temperature Phased Anaerobic Pitchers

  Enzymatic Hydrol

  - Chemical Hydrolysis
  - Lystek
  - Thermal Hydrolysis Process (THP) Traditional CAMBI
  - THP Digestion-Lysis-Digestion (DLD)
  - THP Solid Stream CAMBI

#### **Stabilization Technologies – Fatal Flaw**

	Technology Maturity	Successful Operation of Comparable Size	Available Space	Compatibility

#### **Creation of End to End Alternatives**

#### **Evaluating Technologies and Markets Together**

#### **Initial Alternatives**

- Meso plus second dryer
- Meso plus Class B hauling
- Thermophilic
  - Prepared by Brown and Caldwell With and without second dryer
- Cambi (traditional)
  - With and without second dryer

- Additional Layers
  - Thickening
  - Dewatering
  - Energy alternatives

#### **Alternatives: Power Production**

- Baseline: Existing cogen + drying
- Baseline + gas conditioning
  - Gas conditioning serves to reduce O&M costs associated with engines and dryer
- Existing cogen + vehicle fuel (via pipeline injection or tube trailer)
  - No permit modification to cogen / no DG to dryer
  - Continue to operate two engines
  - Additional gas routed to vehicle fuel
- Existing cogen + microturbines
  - Includes gas conditioning
  - No permit modification to cogen / no DG to dryer
- Existing cogen + steam boiler/turbine
  - No permit modification to cogen / no DG to dryer
  - Additional gas routed to steam boiler; steam used in small turbine
- New cogen permit, CO catalyst and SCR, gas conditioning
  - Need to consider plant demand as a limit on power production
- Vehicle Fuel (primary use of DG) + existing cogen (natural gas + tail gas)

"All in" on vehicle fuel

# Baseline includes cogeneration (permit limited), dryer and some flaring

#### Gas conditioning could reduce engine and dryer O&M costs associated with siloxanes

#### **Baseline with Gas Conditioning**

# With the existing permit in place, where else can we send digester gas to get highest value?

#### **Existing Cogen Options - No Permit Modification**

# A permit modification allows EWA to meet plant electricity demand, but any additional gas would need to go to a non-generating use

# An all-vehicle-fuel option may deliver the best economics

### **Vehicle Fuel**

### Alternatives to be presented at next workshop

  Energy & Energy &

  - Prepared by Brown and Caldwell

## **Grant Updates**

## **Self Generation Incentive Program**

Program	Self-Generation Incentive Program (SGIP)	
Agency	California Energy Commission / administered by SDG&E	
Eligible Projects	Self-generation projects such as new engines, microturbines, or steam turbines – increased incentives for renewable/biogas projects; Energy storage / batteries	
Funding	Incentives based on anticipated power output – based on fuel availability, not nameplate capacity; 50% paid upfront / 50% paid over 5 years based on performance	
Schedule	Funding available each year / first-come, first-served Battery funding decreases as tiers fill up Projects must be operational within 18 months of award	
How much are we talking?	~\$500k - \$1M depending on project size	
Recommendation for SWEET  Analysis	Don't count on funding to justify project economics	
Next steps Continue to track / pursue if selected alternatives meet criteria		

### **Low-Carbon Fuel Standard**

Program	Low-Carbon Fuel Standard (LCFS)	
Agency	California Air Resources Board	
Eligible Projects	Part of AB 32 scoping plan – projects that reduce the carbon intensity of California's vehicle fuel – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, recently extended through 2030	
How much are we talking?	Varies could equate to $\sim$ \$0.50/DGE - \$1.00/DGE depending on marke factors	
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2030, use conservative values	
Next steps	Continue to track / pursue if vehicle fuel is recommended	

### Renewable Fuel Standard

Program	Renewable Fuel Standard	
Agency	US Environmental Protection Agency	
Eligible Projects	Renewable fuel projects – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, not guaranteed beyond 2022	
How much are we talking?	A lot of uncertainty: Wastewater digester gas is eligible for highest value of RINs – D3 EPA has recently stated that DG from food waste is a lower value – D5 EPA has the ability to set RIN quotas, which drive supply-and-demand, market-based pricing	
Recommendation for SWEET Include in SWEET analysis for vehicle fuel projects;  Analysis Assume funding only through 2022, use conservative values		
Next steps Continue to track / pursue if vehicle fuel is recommended		

## **Organics Grant Program**

Program	Organics Grant Program	
Agency	Department of Resource Recovery and Recycling (CalRecycle)	
Eligible Projects	Projects that serve to divert organics (food waste) from landfill – toward anaerobic digestion or composting; recently issued with a food rescue requirement	
Funding	Incentives based on project size and potential tons diverted	
Schedule	Recently awarded, not expected to reissue for ~18 months	
How much are we talking?	Up to \$4M per project	
Recommendation for SWEET  Analysis	Do not include – too competitive to count on	
Next steps	Continue to track / pursue if food waste receiving is recommended	

### Organics Grant Program - Recent Award

#### Recommendation:

Staff recommends approval of 10 grant awards, as listed in Table 1 below, for \$24,000,000.

Table 1. Organics Grant Program Recommended Award – List A

Applicant	County	Total Award
Anaerobic Digestion Projects		
County Sanitation Districts of Los Angeles County	Los Angeles	\$4,000,000

## **Heathy Soils Program**

Program	Healthy Soils Program	
Agency	California Department of Food and Agriculture	
Eligible Projects	Demonstration projects that sequester carbon and reduce GHG emissions – groups within CASA	
Funding	Incentives based on project size and potential GHG benefit	
Schedule	Currently accepting applications through September 19 Annual funding program (AB 32 funds), amounts and criteria may vary	
How much are we talking?	Up to \$3.75M total	
Recommendation for SWEET Analysis	Do not include / ancillary benefit to support end use program	
Next steps	Continue to track / connect with CASA Science and Research Group for potential partnerships	

## **Green Project Reserve**

Program	Green Project Reserve	
Agency	California Water Resources Control Board	
Eligible Projects	Projects that improve energy efficiency, renewable energy generation, or recycled water production	
Funding	A component of Clean Water State Revolving Funding; Green Project Reserve is a "loan forgiveness" program CWSRF is generally oversubscribed, but GPR is underutilized	
Schedule	Ongoing	
How much are we talking?	Up to \$4M per project, or 50% of project value, whichever is higher	
Recommendation for SWEET Analysis	Do not include	
Next steps  Something for EWA to keep in mind – if a larger capital project req funding, consider CWSRF and adding an eligible GPR component		

## **Air Permitting Discussion**

### EWA is actively pursuing air permit modification

- EWA (with Don King) will submit a request for permit modification within ~1 week
- Goal is to adjust the CO emission rate from 530 ppm to ~400 ppm, and thereby adjust the fuel input limit aimed at keeping CO emissions below Title V synthetic minor threshold
- If successful, this effort would increase permitted cogen capacity by ~20%
- This increase would allow EWA to meet plant electricity demand with current digester gas flows and cogen system

## Look Ahead & Wrap-Up

### **Project Schedule**

- Workshop #3 in mid-September
- Draft Analysis and Reports to Begin

### **Look Ahead – September Workshop**

- Consensus on mass balance/baseline
- Conceptual layouts/details of alternatives for consensus/feedback (example numbers to support including biogas production, food waste that can be imported)
- Air permitting impacts on power production alternatives
- Informational meeting with waste haulers
- Debrief on Anaergia meeting
- Grants update

Brown and Caldwell Garage Cald

#### 1 Introduction

#### 1.1 Purposes

This handbook has been prepared to provide an overview of the technical requirements to interconnect Generating Facilities (includes all generators located at an interconnection point) to operate in parallel with SDG&E's distribution system. The requirements are necessary to ensure safe and reliable operation of SDG&E's electric system. The handbook shall serve as a guideline to SDG&E personnel and customer generation owners in completing generation to distribution interconnections that conform to SDG&E reliability requirements.

The interconnections include facility additions and modifications on generation and distribution systems necessary to accommodate the interconnection of generation to SDG&E distribution system. For generation interconnection to the transmission system, refer to **SDG&E Generation Interconnection Handbook**, which can be found on the SDG&E website, link below.

http://www.sdge.com/generation-interconnection-handbook

### 1.2 Applicability and Related Tariffs

All generators connected to the distribution system must meet the technical requirements of this handbook. The handbook is not intended to supersede

Interconnection Agreements required by SDG&E's Electric Rule 21 and/or the Wholesale Distribution Open Access Tariff (WDAT), particularly the Large Generator Interconnection Agreement (LGIA) and Small Generator Interconnection Agreement (SGIA).

### 1.3 Interconnection Agreement Required

The Owner/Operator must execute an Interconnection Agreement with SDG&E, and receive SDG&E's express written permission before parallel operation of its generating facility with SDG&E's Distribution System. SDG&E shall treat all requests in a non-discriminatory manner and shall not unreasonably withhold its permission for Parallel Operation of Owner/Operator's Generating Facility with SDG&E's Distribution System.

### 1.4 Technical Requirement

The technical requirements are organized in five (5) categories:

- Metering
- Protection and Control

- Operating Requirements
- Operating Procedures
- Energization and Synchronization

### 2 Metering Requirements

#### 2.1 Basic Metering Requirements

- On generating facilities < 1 MW, it is recommended that SDG&E metering be installed to measure net generator output (generator output minus auxiliary loads associated with the generator) per SDG&E metering standards and requirements.</p>
- On generating facilities >= 1MW, SDG&E metering shall be installed to measure net generator output (generator output minus auxiliary loads associated with the generator) in addition to SDG&E telemetering.
- SDG&E metering shall be installed to meter import and export at the SDG&E service point(s) regardless of Generating Facility size.
- If the facility is a generating facility serving only auxiliary load with one SDG&E service point, the SDG&E service point is also considered to be the net generator output point, so no additional net generation output meter is required or recommended.
- For a generating facility that requires CAISO (California Independent System Operator) metering, a CAISO meter(s) shall be installed at the SDG&E service point or at the net-generation point(s) per CAISO requirements and policies.

### 2.2 Metering Equipment Layout

A typical metering layout of a generating facility containing load that is not directly associated with generation is illustrated in Figure 1.

Figure 1: Typical Generation Facility Metering Layout (w/ <u>loads</u> not related to generation)

A typical metering layout of a generating facility with only loads associated with generation is illustrated in Figure 2.

Figure 2: Typical Generation Facility Metering Layout (w/ only loads associated with generation)

### 2.3 Metering Sections

- At all points where SDG&E meters are to be installed, the Owner/Operator shall acquire and install a metering section. The metering section includes cable pull sections, bus bars for metering CT/PT insertion; disconnect switches, a metering panel, a meter socket(s), and accommodations for test switches/test blocks. Please refer to pages 676 and 677 of SDG&E's Electric Service Standards & Guide Manual for a typical metering section.
- Detailed information on all new proposed metering sections for the project shall be provided to SDG&E as part of the review and approval process described in the applicable tariff. This includes (but is not limited to) clearances from the metering section and details of the standing surface of the metering section.
- A set of disconnect switches or a rackable breaker shall be placed directly on the line side of each metering section as well as a set of disconnect switches for the metering PT's (accessible by SDG&E personnel only) per SDG&E service requirements. In addition, a set of disconnect switches shall be placed on the load side of the meter or at the point of generator output.
- Locations of these disconnect switches (or rackable breakers) are illustrated in Figures 1 and 2 above.
- The required disconnect switches (or rackable breakers) shall allow visible verification that separation has occurred.
- Disconnect switches are required to be gang operated.
- Disconnect switches and rack-out breakers must accommodate locking devices to allow SDG&E to lock-out services or net-generation points when necessary.
- Suitable locations shall be selected for all SDG&E metering sections per requirement outlined on page 602 of SDG&E's Electric Service Standards & Guide Manual.
- CAISO meters shall be located on the same metering panel plate as SDG&E meters that serve to meter the same point (e.g. net-generation point, SDG&E service point). Both meters will tap off the same metering PT's/CT's with the enclosure/panel having two sockets and test switches. See page 678 of SDG&E's Electric Service Standards & Guide Manual for a typical layout of this panel configuration.
- Any load that precedes point of service metering must be metered by an SDG&E self-contained meter on the same meter panel as that of the SDG&E meter. Typically, this load consists of customer owned PT's feeding control, protection, and monitoring devices. A typical panel layout showing this self-contained metering is shown on pages 679 and 680 of SDG&E's Electric Service Standards & Guide Manual.
- For self-contained meters, the Owner/Operator is required to acquire and install test blocks that meet SDG&E service requirements.

The Electric Service Standards & Guide Manual can be found at:

http://www.sdge.com/electric-service-standards-guide-manual

#### 2.4 Other Metering Requirements

- An activated dial-up phone line shall be provided to each SDG&E meter.
- This phone line shall be routed to the associated meter panel with the SDG&E meter where SDG&E can plug an RJ-11 connector to obtain phone service to the meter. The RJ-11 connection point shall be within 12" of the meter socket.
- Monthly costs and maintenance of the phone lines to SDG&E meters are the responsibly of the Owner/Operator.
- At all SDG&E metering locations where voltage potential may be lost (except in the event of a planned or forced SDG&E outage), the Owner/Operator shall supply each SDG&E meter with a 120VAC uninterruptible power supply (UPS).
- A dedicated breaker position in the UPS breaker panel shall be utilized to supply each meter with UPS power and shall be clearly marked as feeding an SDG&E meter.
- The Owner/Operator may request KYZ outputs from any SDG&E meter for a one-time cost. See Figure 3 shown in Section 2.6 of this handbook for a typical KYZ output configuration.

### 2.5 Metering Equipment Installation

- All metering sections shall be installed by the Owner/Operator.
- Upon final approval of the metering sections, layout, and overall facility, SDG&E personnel will provide, install and wire the metering CT's/PT's, telemetry equipment (if applicable), and test switches in preparation for the installation of SDG&E meters.
- If a CAISO meter is required, SDG&E will wire all CAISO metering. However, an ISO certified contractor is required to perform installs of CAISO meters per arrangements made by the Owner/Operator with the CAISO.

### 2.6 Telemetering Equipment

SDG&E telemetering equipment located at net generation output metering points for generators >= 1MW utilize outputs from SDG&E meters located at the same metering points. See Figure 3 below for typical telemetering configuration.

Figure 3: Typical Telemetering Interface with SDG&E Metering (w/ KYZ outputs to customer)

- Telemetering requires a dedicated 120VAC UPS source. The telemetering equipment enclosure should be placed on or close to the meter panel but is not required to be on the meter panel. A suitable conduit can be used to interconnect the telemetering equipment with the SDG&E meter.
- The telemetering requires a high speed dedicated data line to SDG&E's Grid Operations center.
- Costs associated with the set-up requirements of telemetering equipment (e.g., conduit runs, activated data line) are borne by the Owner/Operator. There is a one-time cost to the Owner/Operator for the SDG&E telemetering equipment.

### 2.7 Meter Reading/Maintenance/Testing

- SDG&E will own, install, maintain, read, and test all SDG&E meters, telemetry
  equipment, metering PT's/CT's, and associated wiring installed at the facility.
- 24hr/7day unrestricted and unescorted access to all metering equipment and metering associated devices shall be provided to SDG&E metering personnel. All locked doors and gates SDG&E metering personnel must pass through to gain access shall each contain a SDG&E Schlage restricted VTQP quad lock supplied and installed by the Owner/Operator. A list of locksmiths authorized by SDG&E to sell Schlage restricted VTQP quad locks is listed on page 005.1 of SDG&E's Electric Service Standards & Guide Manual.
- If required, the Owner/Operator shall be responsible for installing, maintaining, reading, and testing the CAISO meter(s) per CAISO requirements. It is the responsibility of the facility Owner/Operator to comply with all applicable CAISO metering standards and requirements.
- Per SDG&E request, the Owner/Operator of the Generating Facility shall make all necessary arrangements with the CAISO for SDG&E to obtain all 5 min interval data reads from the CAISO meter. SDG&E will in-turn, upon reasonable notification, supply the CAISO with meter data from the SDG&E meter in the event of a CASIO meter failure within a reasonable time-frame, and with the understanding that most SDG&E meters only record IDR data on a 15min basis per SDG&E tariffs.
- The format of these reads must be compatible with SDG&E's meter reading system (MV90) using a Hand-Held Files (HHF) format. SDG&E shall supply the CAISO with meter data in this same HHF format.
- All metering sections and associated equipment are maintained by the Owner/Operator. In the event of a failure or malfunction of this equipment, the Owner/Operator is responsible for all replacements and repairs.
- The metering PT's/CT's, SDG&E meters, and SDG&E telemetry equipment is owned and therefore maintained by SDG&E.
- Repairs and replacements of CAISO meters are the Owner/Operator's responsibility and not the responsibility of SDG&E.

- Upon reasonable advanced notification by SDG&E, the Owner/Operator shall operate disconnect switches and/or rack-out breakers in order for SDG&E to perform maintenance on metering CT/PT's, telemetering equipment, or inspection of the metering section.
- Upon a failure or malfunction of a metering section or SDG&E equipment, the Owner/Operator shall accommodate immediate arrangements with SDG&E to operate disconnects or rack-out breakers.

### 3 Protection and Control Requirements

#### 3.1 Purpose

This section specifies the requirements for protection and control devices for Generating Facilities interconnecting to the SDG&E Distribution System.

The applicable protective standards of this section apply to all Generating Facilities interconnecting to any portion of SDG&E's Distribution System. These standards, which govern the design, construction, inspection and testing of protective devices, have been developed to be consistent with SDG&E's Rule 21, *Interconnection Standards for Non-Utility Owned Generation*, and IEEE 1547, *IEEE Standard for Interconnecting Distributed Resources with Electric Power Systems*.

#### 3.2 General Interconnection and Protective Function Requirements

The Protective Functions and requirements of this Section are designed to protect SDG&E's Distribution System and not the Generating Facility. An Owner/Operator shall be solely responsible for providing adequate protection for its Generating Facility and Interconnection Facilities. The Owner/Operator's protective equipment shall not impact the operation of other protective equipment utilized on SDG&E's Distribution System in a manner that would affect SDG&E's capability of providing reliable service to its Customers.

**Protective Equipment Required -** Generating Facilities operating in parallel with SDG&E's Distribution System shall be equipped with protective devices that will sense abnormal conditions on SDG&E's Distribution System and will: cause the Generating Facility to automatically disconnect from SDG&E's Distribution System, or will prevent the Generating Facility from being connected to SDG&E's Distribution System inappropriately. These protective functions include:

- 1) Over and under voltage trip functions and over and under frequency trip functions;
- 2) A voltage and frequency sensing and time-delay function that will prevent the Generating Facility from energizing a de-energized Distribution System circuit, and will prevent the Generating Facility from reconnecting with SDG&E's Distribution System unless SDG&E's Distribution System service voltage and frequency is: a) within the ANSI C84.1-1995 Table 1 Range B Voltage Range of 106V to 127V (on a 120V basis), inclusive, and b) within a frequency range of 59.7 Hz to 60.5 Hz inclusive, and is stable for at least 60 seconds.
- 3) A function to prevent the Generating Facility from contributing to the formation of an Unintended Island, and cease to energize SDG&E's Distribution System within two seconds of the formation of an Unintended Island.

The Generating Facility shall cease to energize SDG&E's Distribution System for faults on SDG&E's Distribution System circuit to which it is connected (IEEE1547-4.2.1). The Generating Facility shall cease to energize SDG&E's Distribution circuit prior to reclosure by SDG&E's Distribution System equipment (IEEE1547-4.2.2).

**Momentary Paralleling Generating Facilities** - With SDG&E's approval, the transfer switch or scheme used to transfer the Owner/Operator's loads from SDG&E's Distribution System to Owner/Operator's Generating Facility may be used in lieu of the protective functions required for Parallel Operation.

Suitable Equipment Required - Circuit breakers or other interrupting equipment located at the Point of Common Coupling (PCC) must be Certified or "Listed" (as defined in Article 100, the Definitions Section of the National Electrical Code) as suitable for their intended application. This includes being capable of interrupting the maximum available fault current expected at their location. Owner/Operator's Generating Facility and Interconnection Facilities shall be designed so that the failure of any single device or component shall not potentially compromise the safety and reliability of SDG&E's Distribution System. The Generating Facility paralleling-device shall be capable of withstanding 220% of the Interconnection Facility rated voltage (IEEE1547-4.1.8.3). The Interconnection Facility shall have the capability to withstand voltage and current surges in accordance with the environments defined in IEEE Std C62.41.2-2002 or IEEE Std C37.90.1-2002 as applicable and as described in Rule 21 Section J.3.e (IEEE1547-4.1.8.2).

**Visible Disconnect Required** - When required by SDG&E's operating practices, the Owner/Operator shall furnish and install a ganged, manually-operated isolating switch (or a comparable device mutually agreed upon by SDG&E and the Owner/Operator) near the Point of Interconnection to isolate the Generating Facility from SDG&E's Distribution System. The device does not have to be rated for load break nor provide over-current protection. The device must:

- 1) Allow visible verification that separation has been accomplished. (This requirement may be met by opening the enclosure to observe contact separation.)
- 2) Include markings or signage that clearly indicates open and closed positions.
- 3) Be capable of being reached quickly and conveniently 24 hours a day by SDG&E personnel for construction, operation, maintenance, inspection, and testing or reading without: a) obstacles, b) a requirement to seek access to climb over or remove obstacles, or c) a requirement to obtain keys, special permission, or security clearances.
- 4) Be capable of being locked in the open position.
- 5) Be clearly marked on the submitted single line diagram and its type and location approved by SDG&E prior to installation. If the device is not

adjacent to the PCC, permanent signage must be installed at an SDG&E approved location providing a clear description of the location of the device.

Generating Facilities with Non-Islanding inverters totaling one (1) kilovolt-ampere (kVA) or less are exempt from this requirement.

**Drawings Required -** Prior to Parallel Operation or Momentary Parallel Operation of the Generating Facility, SDG&E shall approve the Owner/Operator's protective function and control diagrams. Generating Facilities equipped with protective functions and a control scheme previously approved by SDG&E for system-wide application or only Certified Equipment may satisfy this requirement by reference to previously approved drawings and diagrams.

#### 3.3 Prevention of Interference

The Owner/Operator shall not operate Generating or Interconnection Facilities that superimpose a voltage or current upon SDG&E's Distribution System, or that interferes with SDG&E operations, service to SDG&E customers, or communication facilities. If such interference occurs, the Owner/Operator must diligently pursue and take corrective action at its own expense after being given notice and reasonable time to do so by SDG&E. If the Owner/Operator does not take corrective action in a timely manner, or continues to operate the facilities causing interference without restriction or limit, SDG&E may, without liability, disconnect the Owner/Operator's facilities from SDG&E's Distribution System, in accordance with Section 3.4 of the Wholesale Open Access Distribution Tariff Small Generator Interconnection Agreement (WDAT SGIA). Below is a link to the WDAT SGIA:

http://www.sdge.com/generation-interconnections/wholesale-generator-transmission-interconnections

To eliminate undesirable interference caused by its operation, each Generating Facility (GF) shall meet the following criteria:

**Voltage Regulation -** The GF shall not actively regulate the voltage at the PCC while in parallel with SDG&E's Distribution System. The GF shall not cause the service voltage at other customers to go outside the requirements of ANSI C84.1-1995, Range A (IEEE1547-4.1.1).

**Operating Voltage Range -** The voltage ranges in Table 1 below define protective trip limits for the protective function and are not intended to define or imply a voltage regulation function. Generating Facilities shall cease to energize SDG&E's Distribution System within the prescribed trip time whenever the voltage at the PCC deviates from the allowable voltage operating range. The protective function shall detect and respond to voltage on all phases to which the Generating Facility is connected.

 Generating Facilities (30 kVA or less) - Generating Facilities with a Gross Nameplate Rating of 30 kVA or less shall be capable of operating within the

voltage range normally experienced on SDG&E's Distribution System from 114V to 126V on a 120V base, at the service panel or PCC. The trip settings at the generator terminals may be selected in a manner that minimizes nuisance tripping between 106 volts and 132 volts on a 120-volt base (88%-110% of nominal voltage) to compensate for voltage drop between the generator terminals and the PCC. Voltage may be detected at either the PCC or the Point of Interconnection. However, the normal operating voltage range at the PCC, with the generator on-line, shall stay within +/- 5% of nominal voltage.

- 2) Generating Facilities (greater than 30 kVA) SDG&E may have specific operating voltage ranges for Generating Facilities with Gross Nameplate Ratings greater than 30 kVA, and may require adjustable operating voltage settings. In the absence of such requirements, the Generating Facility shall operate at a range between 88% and 110% of the applicable interconnection voltage. Voltage shall be detected at either the PCC or the Point of Interconnection, with settings compensated to account for the voltage at the PCC. However, the normal operating voltage range at the PCC, with the generator on-line, shall stay within +/- 5% of nominal voltage.
- 3) Voltage Disturbances Whenever SDG&E's Distribution System voltage at the Point of Common Coupling varies from and remains outside normal (nominally 120 volts) by the predetermined amounts set forth in Table 1, the Generating Facility's protective functions shall cause the Generator(s) to become isolated from SDG&E's Distribution System.

**Table 1: Voltage Trip Settings** 

Voltage at Generator Terminal or Point of Common Coupling (the ranges below are used to trip the generator during abnormal conditions)		Maximum Trip Time [1]	
Assuming 120 V Base	% of Nominal Voltage	# of Cycles (Assuming 60Hz Nominal)	Seconds
Less than 60 Volts	Less than 50%	10 Cycles	0.16 Seconds
Greater than or equal to 60 Volts but less than 106 Volts	Greater than or equal to 50% but less than 88%	120 Cycles	2 Seconds
Greater than 132 Volts but less than or equal to 144 Volts	Greater than 110% but less than or equal to 120%	60 Cycles	1 Second
Greater than 144 Volts	Greater than 120%	10 Cycles	0.16 Seconds

<sup>[1] -&</sup>quot;Maximum Trip time" refers to the time between the onset of the abnormal condition and the Generating Facility ceasing to energize SDG&E's Distribution System. Protective function sensing equipment and circuits may remain connected to SDG&E's Distribution System to allow sensing of electrical conditions for use by the "reconnect" feature. The purpose of the allowed time delay is to allow a Generating Facility to "ride through" short-term disturbances to avoid nuisance tripping. Set

points shall not be user adjustable (though they may be field adjustable by qualified personnel). For Generating Facilities with a Gross Nameplate Rating greater than 30 kVA, set points shall be field adjustable and different voltage set points and trip times from those in Table 1 may be negotiated with SDG&E.

**Paralleling** - The Generating Facility shall parallel with SDG&E's Distribution System without causing a voltage fluctuation at the PCC greater than ±5% of the prevailing voltage level of SDG&E's Distribution System, and meet the flicker requirements of this section. (IEEE1547-4.1.3)

Flicker - The Generating Facility shall not create objectionable flicker for other customers on SDG&E's Distribution System. To minimize the adverse voltage effects experienced by other customers (IEEE1547-4.3.2), flicker at the Point of Common Coupling caused by the Generating Facility should not exceed the limits defined by the "Maximum Borderline of Irritation Curve" identified in IEEE 519-1992 (IEEE Recommended Practices and Requirements for Harmonic Control in Electric Power Systems, IEEE STD 519-1992, Institute of Electrical and Electronic Engineers, Piscataway, NJ). This requirement is necessary to minimize the adverse voltage affects experienced by other customers on SDG&E's Distribution System. Generators may be connected and brought up to synchronous speed (as an induction motor) provided these flicker limits are not exceeded.

Integration with SDG&E's Distribution System Grounding - The grounding scheme of the Generating Facility interconnection shall not cause overvoltages that exceed the rating of the equipment connected to SDG&E's Distribution System, and shall not disrupt the coordination of the ground fault protection on the SDG&E's Distribution System (IEEE1547-4.1.2) (See Section I.3.h). The gas standard must be followed where electrical equipment is in the vicinity of the gas meter assembly. Any electrical connection to SDG&E's gas equipment is a violation of the Code and is unsafe. Electric bonding to SDG&E's gas service pipes, gas riser, or gas meter assembly is not permitted (Gas Standard page 1003).

**Frequency** - SDG&E controls system frequency, and the Generating Facility shall operate in synchronism with the SDG&E's Distribution System. Whenever SDG&E's Distribution System frequency at the Point of Common Coupling varies from and remains outside normal (nominally 60 Hz) by the predetermined amounts set forth in Table 2 below, the Generating Facility's protective functions shall cease to energize SDG&E's Distribution System within the stated maximum trip time.

**Table 2: Frequency Trip Settings** 

Generating Facility Rating:	Frequency Rating (60Hz Nominal) Maximum Trip Time (Assuming 60 Cycles per S	
Lancara annal da 201.W	Less than 59.3 Hz	10 Cycles
Less or equal to 30kW	Greater than 60.5 Hz	10 Cycles
	Less than 57.0 Hz	10 cycles
Greater than 30kW	Less than an adjustable value between 59.8 Hz and 57 Hz but greater than 57 Hz. [2]	Adjustable between 10 and 18,000 Cycles. [2, 3]
	Greater than 60.5 Hz	10 Cycles

<sup>[1] -&</sup>quot;Maximum Trip time" refers to the time between the onset of the abnormal condition and the Generating Facility ceasing to energize SDG&E's Distribution System. Protective function sensing equipment and circuits may remain connected to SDG&E's Distribution System to allow sensing of electrical conditions for use by the "reconnect" feature. The purpose of the allowed time delay is to allow a Generating Facility to "ride through" short-term disturbances to avoid nuisance tripping. Set points shall not be user adjustable (though they may be field adjustable by qualified personnel). For Generating Facilities with a Gross Nameplate Rating greater than 30 kVA, set points shall be field adjustable set points and trip times from those in Table 2 may be negotiated with SDG&E.
[2] - Unless otherwise required by SDG&E, a trip frequency of 59.3 Hz and a maximum

trip time of 10 cycles shall be used.

<sup>[3] -</sup> When a 10 cycle Maximum trip time is used, a second under frequency trip setting is not required.

Distortion (%)

**Harmonics** - When the Generating Facility is serving balanced linear loads, harmonic current injection into SDG&E's Distribution System at the PCC shall not exceed the limits stated below in Table 3 below. The harmonic current injections shall be exclusive of any harmonic currents due to harmonic voltage distortion present in SDG&E's Distribution System without the Generating Facility connected (IEEE1547-4.3.3). The harmonic distortion of a Generating Facility located at a Customer's site shall be evaluated using the same criteria as for the Host Loads.

Individual Total demand harmonic order, h (odd h < 11  $11 \le h < 17$  $17 \le h \le 23$  $23 \le h < 35$  $35 \le h$ distortion harmonics) (TDD) [1] Max 2.0 0.6 0.3 5.0 4.0 1.5

Table 3: Maximum harmonic current distortion in percent of current (I) [1,2]

**Direct Current Injection** - Generating Facilities should not inject direct current greater than 0.5% of rated output current into SDG&E's Distribution System.

**Power Factor** - Each Generator in a Generating Facility shall be capable of operating at some point within a power factor range from 0.90 leading to 0.90 lagging. Operation outside this range is acceptable provided the reactive power of the Generating Facility is used to meet the reactive power needs of the Host Loads, or that reactive power is otherwise provided under tariff by SDG&E. The Owner/Operator shall notify SDG&E if it is using the Generating Facility for power factor correction. Unless otherwise agreed upon by the Owner/Operator and SDG&E, Generating Facilities shall automatically regulate power factor, not voltage, while operating in parallel with SDG&E's Distribution System.

## 3.4 Technology Specific Requirements

Three-Phase Synchronous Generators - For three-phase Generators, the Generating Facility circuit breakers shall be three-phase devices with electronic or electromechanical control. The Owner/Operator shall be responsible for properly synchronizing its Generating Facility with SDG&E's Distribution System by means of either manual or automatic synchronizing equipment. Automatic synchronizing is required for all synchronous Generators that have a Short Circuit Contribution Ratio (SCCR) exceeding 0.05. Loss of synchronism protection is not required except as may be necessary to meet flicker requirements (IEEE1547-4.2.5). Unless otherwise agreed upon by the Owner/Operator and SDG&E, synchronous Generators shall automatically regulate power factor, not voltage, while operating in parallel with SDG&E's Distribution System. A power system stabilization function is

<sup>[1] -</sup> Even harmonics are limited to 25% of the odd harmonic limits above.

specifically not required for Generating Facilities under 10 MW Net Nameplate Rating.

Induction Generators - Induction Generators (except self-excited Induction Generators) do not require a synchronizing function. Starting or rapid load fluctuations on induction generators can adversely impact SDG&E's Distribution System's voltage. Corrective step-switched capacitors or other techniques may be necessary and may cause undesirable ferro-resonance. When these counter measures (e.g., additional capacitors) are installed on the Owner/Operator's side of the Point of Common Coupling, SDG&E must review these measures. Additional equipment may be required as determined in an interconnection review or an Interconnection Study.

**Inverters** - Utility-interactive inverters do not require separate synchronizing equipment. Non-utility-interactive or "stand-alone" inverters shall not be used for Parallel Operation with SDG&E's Distribution System.

**Single-Phase Generators** - For single-phase Generators connected to a shared single-phase secondary system, the maximum Net Nameplate Rating of the Generating Facilities shall be 20 kVA. Generators connected to a center-tapped neutral 240-volt service must be installed such that no more than 6 kVA of imbalanced power is applied to the two "legs" of the 240-volt service. For Dedicated Distribution Transformer services, the maximum Net Nameplate Rating of a single-phase Generating Facility shall be the transformer nameplate rating.

## 3.5 Inverter Specifications

**Reactive Power** - The inverter shall be capable of operating in the following reactive power modes:

 Dynamic power factor: Inverter shall be capable of operating dynamically at a minimum power factor range of +/- .85 PF for larger systems (>15 kW), +/- 0.90 PF for smaller systems (≤15 kW), and a preferred power factor range of +/- 0.10 PF.
 Figure 4 below illustrates the preferred power factor range of +/- 0.10 PF.

Figure 4: P-Q Capability Curve

- Dynamic VAR output or input:
  - Inverter shall autonomously prevent line voltage changes from exceeding 2% at the point of common coupling (PCC) due to a loss of generation, or due to an increase in generation output. Inverter output shall not cause the line voltage at the point of common coupling to go outside the requirements of the latest version of ANSI C84.1, Range A.
  - Dynamic VAR output/input function shall not operate within a total deadband of 2% (i.e. a range of +/-1%) of line voltage at the PCC.
- Autonomous operations described above may be superseded by an external signal issued by distribution system operator.

The reactive power output of the inverter must be dynamic and adjustable. It must be possible to provide the prescribed reactive power compensation within the following time constraints:

- Within 10 seconds if reactive power setting is prescribed by autonomous control
- Within 5 seconds if reactive power setting is prescribed by external signal which will supersede autonomous settings.
- No change in reactive compensation shall occur unless the voltage changes outside the deadband range of 2% (+/-1%)

The inverter shall consume reactive power in response to an increase in line voltage, and generate reactive power in response to a decrease in line voltage. An example of the desired correlation between reactive power output and changes in line voltage is shown below.

#### Low Voltage Ride-Through:

Inverters shall stay connected to the electric grid, and shall disconnect from the electric grid during a high or low voltage event, in compliance with the parameters shown in the following table and graph:

**Table 4: Low Voltage Ride-Through Percent of Nominal** 

Voltage Level	Stay Connected Until	Voltage level	Disconnect by
>1.17	0.1 sec	>1.2	0.16
1.07-1.17	12 sec.	1.1 - 1.2	13 sec
0.92-1.07	Indefinite	0.6 - 0.88	21 sec
0.7 - 0.92	20 sec	0.45 - 0.6	11 sec
0.5 - 0.7	10 sec	0 - 0.45	0.16 sec
0 - 0.5	0.1 sec		

#### **Randomization of Inverter Disconnect and Reconnect**

If voltage limits are exceeded and inverter disconnection is imminent, disconnection shall employ timing randomization so that multiple inverters do not disconnect simultaneously for the same system voltage disturbance. And after such disconnection, inverters shall reconnect using timing randomization to avoid multiple inverters connecting simultaneously after a system disturbance. The randomization of timing for disconnection and reconnection scenarios shall be:

- Disconnection: If voltage limits are exceeded, inverters shall disconnect at a random time during a window of an additional 0 to 10% beyond the elapsed time from initial fault.
- Reconnection: After an inverter has disconnected due to a system disturbance, it will reconnect at a random time during a window of an additional 0 to 10 seconds beyond the earliest allowable reconnection time.

#### **Extended Frequency Ride-Through:**

Inverters shall accommodate, at a minimum, underfrequency and overfrequency operation in compliance with the WECC Off Nominal Frequency Load Shedding Plan, as provided in the table below. In general the inverter would not trip off line at any frequency greater than 57 Hz or less than 60.3 Hz.

Underfrequency Limit	Overfrequency Limit	Minimum Time*
>59.4 Hz	< 60.6 Hz	N/A (continuous operation)
≤59.4 Hz	≥60.6 Hz	3 minutes
≤58.4 Hz	≥61.6 Hz	30 seconds
≤57.8 Hz		7.5 seconds
≤57.3 Hz		45 cycles
≤57.0 Hz	≥61.7 Hz	Instantaneous trip

<sup>\*</sup> Minimum Time is the time the inverter should stay interconnected with the PV generator power being supplied to the grid.

#### Communications:

Inverters will have communications capabilities and security control mechanism that will comply with all applicable System Requirements (SRs) of standard ISA 99.03.03 for Security for Industrial Automation and Control Systems: System Security Requirements and Security Assurance Levels, Draft 2, Edit 30, published September 2010. It is also desirable (but not required) that the inverter and its associated computing components shall be ISA-099 certified/accredited.

## 3.6 Supplemental Generating Facility Requirements

Fault Detection - A Generating Facility with an SCCR exceeding 0.1 or one that does not cease to energize SDG&E's Distribution System within two seconds of the formation of an Unintended Island shall be equipped with protective functions designed to detect Distribution System faults, both line-to-line and line-to-ground, and shall cease to energize SDG&E's Distribution System within two seconds of the initiation of a fault.

Will have to implement directional overcurrent and line ground fault detection in the existing relays. Requires replacement of existing open delta VTs with wye-wye VTs.

**Transfer Trip** - For a Generating Facility that cannot detect Distribution System faults (both line-to-line and line-to-ground) or the formation of an Unintended Island, the facility must cease to energize SDG&E's Distribution System within two seconds. SDG&E may require a Transfer Trip system or an equivalent Protective Function.

**Reclose Blocking** - Where the aggregate Generating Facility capacity exceeds 15% of the maximum rating of any automatic reclosing device, SDG&E may require additional protective functions, including, but not limited to, reclose-blocking on some of the automatic reclosing devices.

Unknown if required until SDG&E performs interconnection study.

## 4 Operating Requirements

#### 4.1 Generator Step-up Transformer

The available voltage taps of a Generating Unit's step-up transformer must be reviewed by SDG&E for their suitability with SDG&E's system. The Generator is to request this review before acquiring the transformer.

SDG&E shall determine which voltage taps would be suitable for a step-up transformer for the Generator's proposed project. Suitable taps are required to give the transformer the essential capacity for the generator to:

- Deliver maximum reactive power to SDG&E's system at the point of interconnection (generator operating at 90 percent lagging power factor) and,
- Absorb maximum reactive power from SDG&E's system (generator operating at 95 percent leading power factor).

The Generating Unit's transformer, with correct voltage taps, helps maintain a specified voltage profile on SDG&E's system for varying operating conditions. Actual voltage tap settings can be different for transformers connected at the same voltage level, depending upon their geographic location.

### 4.2 Power Quality Requirements

**Voltage Fluctuation Limits** - A generator connected to the SDG&E system must not cause harmful voltage fluctuations or interference with service and communication facilities. Any generating facility that does so is subject to being disconnected from the SDG&E system until the condition has been corrected.

**Harmonics Limits -** All generators shall comply with the voltage and current harmonic limits specified in IEEE Standard 519-1992, "Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems".

- The harmonic content of the voltage and current waveforms in the SDG&E system must be restricted to levels which do not cause interference or equipment-operating problems for SDG&E or its customers.
- Many methods may be used to restrict harmonics. The preferred method is to install a transformer with at least one delta connection between the generator and the SDG&E system. This method significantly limits the amount of voltage and current harmonics entering the SDG&E system. Generation system configuration with a wye-grounded generator and a two-winding (both wye-grounded) transformer shall not be allowed.
- When the Generating Facility is serving balanced linear loads, harmonic current injection into SDG&E's Distribution System at the PCC shall not exceed the limits stated in Table 3 shown in Section 3.3 of this handbook. The harmonic current injections shall be exclusive of any harmonic currents due to harmonic voltage distortion present in SDG&E's Distribution System

without the Generating Facility connected (IEEE 1547-4.3.3). The harmonic distortion of a Generating Facility located at a Customer's site shall be evaluated using the same criteria as for the Host Loads.

## 4.3 Under-frequency Operation

SDG&E controls system frequency, and the Generating Facility shall operate in synchronism with SDG&E's Distribution System. Whenever SDG&E's Distribution System frequency at the PCC varies from and remains outside of the normal (nominally 60 Hz) by the predetermined amounts set forth in Table 2 shown in Section3.3, the Generating Facility's Protective Functions shall cease to energize SDG&E's Distribution System within the stated maximum trip time.

## 5 Operating Procedures

#### 5.1 **CVR Standards**

In 1977, the CPUC mandated the Conservation Voltage Reduction (CVR) standards. Approximately 95% of SDG&E substations are CVR and the remaining are NON-CVR. For CVR substations, the voltage maximum limit is 12.3kV and the adjustable voltage range shall be 11.9kV to 12.3kV. For NON-CVR substations, the voltage maximum limit is 12.6kV and the adjustable voltage range shall be 12.1kV to 12.6kV. The specific voltage set point will be provided to the interconnect customer after completion of load flow modeling with the generator on the distribution circuit.

### 5.2 Voltage Control Operation and Other Service Requirements

The Generating facility operator shall operate any voltage control (i.e., generator controls, shunt capacitors) at the direction of the SDG&E Designated Control Center and in accordance with applicable provisions of applicable agreements, applicable tariff(s), CAISO requirements if required and other electric service schedules. The facility operator shall insure the orders are understood and passed on to subsequent shift operator as appropriate to insure that any relief or backup operator is aware of the current SDG&E voltage instruction. The Generator is responsible for the safe operation and interruption and de-energization of the customer-owned voltage control devices when required.

Whenever primary relays or protective devices are out of service, backup or secondary relays must be available to clear faults. When restoring any relays that have been out of service, the Generator's designated representative shall verify that the contacts of any such relays, which are normally open, are in fact open. The Generator must ensure that relays do not have standing trip output.

## 5.3 Unusual or System Emergency Conditions

SDG&E is responsible for complying with all directions from the CAISO regarding management and alleviation of the System Emergency, unless such compliance would impair the Health and Safety of personnel or the general public. As directed by the CAISO, SDG&E will be responsible for communicating with Generating Facilities regarding emergencies. Unusual operating conditions or other factors that have affected or may affect SDG&E's electric system (e.g., abnormal voltages or loading or unbalanced loading) must be reported to the SDG&E Designated Control Center as soon as possible. Conditions imperiling life or property shall be reported to the SDG&E Designated Control Center immediately.

## 6 Energization and Synchronization Requirements

#### 6.1 **Purpose**

The following is SDG&E's procedure for performing pre-parallel inspections and preparing to energize and synchronize the generator to SDG&E's Distribution System. All time requirements must be met for SDG&E to provide the Generating Units with timely service.

Any inspections required by local government agencies must be completed and permits signed off prior to the pre-parallel date. Failure to meet the succeeding requirements within the timeframes specified may result in a delay to successful operations parallel to the SDG&E system.

### 6.2 Design Review and Interconnection Facilities Inspection

SDG&E shall have the right to review the design of an Owner/Operator's Generating and Interconnection Facilities and to inspect an Owner/Operator's Generating and/or Interconnection Facilities prior to the commencement of Parallel Operation with SDG&E's Distribution System. SDG&E may require an Owner/Operator to make modifications as necessary to comply with the requirements of this Handbook. SDG&E's review and authorization for Parallel Operation shall not be construed as confirming or endorsing the Owner/Operator's design, nor as warranting the Generating and/or Interconnection Facility's safety, durability or reliability. SDG&E shall not, by reason of such review or lack of review, be responsible for the strength, adequacy, or capacity of such equipment.

## 6.3 **Pre-parallel Testing**

Commissioning Testing, where required, will be performed on-site to verify protective settings and functionality. Upon initial Parallel Operation of a Generating Facility, or any time interface hardware or software is changed that may affect the functions listed below, a Commissioning Test must be performed. An individual qualified in testing protective equipment (professional engineer, factory-certified technician, or licensed electrician with experience in testing protective equipment) must perform Commissioning Testing in accordance with the manufacturer's recommended test procedure to verify the settings and requirements per this handbook.

SDG&E may require that a written commissioning test procedure be submitted at least 10 working days prior to the performance of the commissioning test. SDG&E has the right to witness Commissioning Tests. SDG&E may also require written Certification by the installer describing which tests were performed and their results. Protective Functions to be tested during commissioning, particularly with respect to non-Certified Equipment, may consist of the following:

- Over and under voltage
- Over and under frequency

- Anti-Islanding Function (if applicable)
- Non-Export Function (if applicable)
- Inability to energize dead line
- Time delay on restart after utility source is stable
- Utility system fault detection (if used)
- Synchronizing controls (if applicable)
- Other Interconnection Protective Functions that may be required as part of the Interconnection Agreement

Commissioning Test shall include visual inspections of the interconnection equipment and protective settings to confirm compliance with the interconnection requirements.

Other checks and tests that may need to be performed include:

- Verifying final Protective Function settings
- Trip test
- In-service test

#### 6.3.1 Certified Equipment

Generating Facilities qualifying for Simplified Interconnection must incorporate Certified Equipment that has, at a minimum, passed the Type Tests and Production Tests described in this handbook and are judged to have little or no potential impact on SDG&E's Distribution System. For such Generating Facilities, it is necessary to perform the following tests:

- 1) Protective function settings that have been changed after Production Testing will require field verification. Tests shall be performed using injected secondary frequencies, voltages and currents, applied waveforms, a test connection using a Generator to simulate abnormal utility voltage or frequency, or varying the set points to show that the device trips at the measured (actual) utility voltage or frequency.
- 2) The Non-Islanding Function will be checked by operating a load break disconnect switch to verify the Interconnection equipment ceases to energize SDG&E's Distribution System and does not re-energize it for the required time delay after the switch is closed.
- 3) The Non-Exporting Function shall be checked using secondary injection techniques. This function may also be tested by adjusting the Generating

Facility output and local loads to verify that the applicable Non-Exporting criteria (i.e., reverse power or under power) are met.

The Supplemental Review or an Interconnection Study may impose additional components or additional testing.

#### 6.3.2 Non-Certified Equipment

Non-Certified Equipment shall be subjected to the appropriate tests described in Rule 21 under Type Testing (Section J.3.) as well as those described in Certified Equipment Commissioning Tests (Section J.5.c.). With SDG&E's approval, these tests may be performed in the factory, in the field as part of commissioning, or a combination of both. SDG&E, at its discretion, may also approve a reduced set of tests for a particular Generating Facility or, for example, if it determines it has sufficient experience with the equipment.

#### 6.3.3 Verification of Settings

At the completion of Commissioning testing, the Owner/Operator shall confirm all devices are set to SDG&E-approved settings. Verification shall be documented in the Commissioning Test Certification.

### 6.4 Requirements for Commercial (Parallel) Operation

An Owner/Operator's Generating Facility and Interconnection Facilities shall be reasonably accessible to SDG&E personnel as necessary for SDG&E to perform its duties and exercise its rights under its tariffs approved by the Commission, and any Interconnection Agreement between SDG&E and the Owner/Operator.

An Owner/Operator shall operate and maintain its Generating Facility and Interconnection Facilities in accordance with Prudent Electrical Practices and shall maintain compliance with this Handbook.

SDG&E may limit the operation, disconnect, or require the disconnection of an Owner/Operator's Generating Facility from SDG&E's Distribution System at any time, with or without notice, in the event of an Emergency, or to correct Unsafe Operating Conditions. SDG&E may also limit the operation, disconnect, or require the disconnection of an Owner/Operator's Generating Facility from SDG&E's Distribution System upon the provision of reasonable written notice: 1) to allow for routine maintenance, repairs or modifications to SDG&E's Distribution System; 2) upon SDG&E's determination that a Owner/Operator's Generating Facility is not in compliance with this Handbook and any applicable tariffs or rules that apply to the interconnection; or 3) upon termination of the Interconnection Agreement. Upon the Owner/Operator's written request, SDG&E shall provide a written explanation of the reason for such curtailment or disconnection.

#### 6.4.1 Trip Tests

Interconnection Protective Functions and devices (e.g., reverse power relays) that have not previously been tested as part of the Interconnection Facilities with their associated interrupting devices (e.g. contactor or circuit breaker) shall be trip tested during commissioning. The trip test shall be adequate to prove that the associated interrupting devices open when the protective devices operate. Interlocking circuits between Protective Function devices or between interrupting devices shall be similarly tested unless they are part of a system that has been tested and approved during manufacturing.

#### 6.4.2 In-service Tests

Interconnection Protective Functions and devices that have not previously been tested as part of the Interconnection Facilities with their associated instrument transformers or that are wired in the field shall be given an in-service test during commissioning. This test will verify proper wiring, polarity, CT/PT ratios, and proper operation of the measuring circuits. The in-service test shall be made with the power system energized and carrying a known level of current. A measurement of the magnitude and phase angle of each Alternating Current (AC) voltage and current connected to the protective device shall be made and the results shall be compared to expected values. For protective devices with built-in Metering Functions that report current and voltage magnitudes and phase angles, or magnitudes of current, voltage, and real and reactive power, the metered values may be used for in-service testing. Otherwise, portable ammeters, voltmeters, and phase-angle meters shall be used.

#### 6.4.3 Periodic Testing

Periodic Testing of Interconnection-related Protective Functions shall be performed as specified by the manufacturer, or at least every four years. All periodic tests prescribed by the manufacturer shall be performed. The Owner/Operator shall maintain periodic test reports or a log for inspection by SDG&E. Periodic Testing conforming to SDG&E test intervals for the particular Line Section may be specified by SDG&E under special circumstances, such as high fire hazard areas. Batteries used to activate any Protective Function shall be checked and logged once per month for proper voltage. Once every four years, these batteries must be replaced or a discharge test must be performed.

#### 7 Attachments

#### 7.1 **Tariffs**

SDG&E offers open access, wholesale distribution service to eligible customers, under the rates, terms and conditions set forth by the CPUC, California Public Utilities Commission. Below is the link to the SDG&E Wholesale Distribution Open Access Tariff (WDAT) outlining integration of Distribution SGIP, Small Generator Interconnection Procedures, and Distribution LGIP, Large Generator Interconnection Procedures, to the WDAT.

http://www.sdge.com/rates-regulations/tariff-information/open-access-ferc-tariffs

### 7.2 Interconnection Applications

For an interconnection to the distribution system for a project that *does not* intend to resell the power generated back to the market, a Rule 21 Interconnection Application is required to be completed and issued to SDG&E. Upon receipt of the application, SDG&E will review the request as outlined in Rule 21. Below is an internet link to the application document and other information about interconnection.

http://www.sdge.com/rates-regulations/tariff-information/open-access-ferctariffs

For an interconnection to the distribution system that intends to resell the power generated back to the market and the project is no larger than 20 MW in size, a Small Generation Interconnection Procedures (SGIP) Interconnection Application from SDG&E's Wholesale Distribution Open Access Tariff (WDAT) is required to be completed and submitted to SDG&E. Upon receipt of the application, SDG&E will review the request as outlined in the SGIP WDAT tariff.

For an interconnection to the distribution system for a project that intends to resell the power generated back to the market and is larger than 20 MW in size, a Large Generation Interconnection Procedures (LGIP) Interconnection Application from SDG&E's Wholesale Distribution Open Access Tariff (WDAT) is required to be completed and submitted to SDG&E. Upon receipt of the application, SDG&E will review the request as outlined in the LGIP WDAT tariff.

Below, and as shown in section 7.1, is an internet link that contains the WDAT application documents and summaries as well as other information about generation interconnections to SDG&E's system.

mgd	million gallons per day		

## **Executive Summary**

The Encina Water Pollution Control Facility (EWPCF) operates an Alternative Fuels Receiving Facility to accept high-strength waste (HSW) that is co-digested with municipal solids to increase biogas production. This Technical Memorandum (TM) 4 provides an evaluation of enhancements to the biogas train including alternative technologies for increasing biogas production, increasing the utilization and recovery of the biogas, and improving the treatment and management of the biogas. Biogas train enhancements include biogas treatment (conditioning), biogas storage, and waste activated sludge (WAS) pretreatment to improve volatile solids reduction and increase biogas production. Screening and ranking of technologies was performed in a workshop on August 16, 2017, with Encina Wastewater Authority (EWA) staff. The technologies that passed the fatal-flaw filter are summarized in Table ES-1. Technologies that did not pass the fatal-flaw filter were eliminated. Those technologies that passed the fatal-flaw filter moved on and were assessed using evaluation criteria developed to reflect EWA's values and goals for the project, which are summarized in Table 2-3.

Table ES-1. Biogas Train Enhancements					
Gas Treatment Technology Gas Storage Technology WAS Pretreatment Technology					
Gas conditioning	Piston-type gas holder	WAS-only Cambi THP			
Gas conditioning + exhaust treatment	Dual-membrane gas storage				
Biogas upgrading					

THP = thermal hydrolysis process

In addition, the Brown and Caldwell (BC) team evaluated the possibility of increasing co-digestion of HSW at EWPCF to increase biogas production for use in the alternative power production technologies.

## **Section 1: Introduction**

EWA has undertaken a Biosolids Energy and Emissions (BEE) Plan, which will serve to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan (PMP). The BEE Plan has several goals:

- Provide a comprehensive analysis of all project elements, including biosolids treatment, gas use, energy generation, and waste heat
- Address capacity limitations in the solids-handling process at EWPCF
- Assess which alternative is likely to be the most cost-effective and sustainable solution for EWA
- Move EWPCF toward greater energy independence
- Reduce greenhouse gas (GHG) emissions

The purpose of TM 4 is to document the technology screening for co-digestion opportunities, sludge pretreatment technologies, and biogas treatment and storage alternatives. This TM does not provide an alternatives analysis, but provides insight to the methodology and rationale that were used to select alternatives that will move forward for further analysis in the Solids Water Energy Evaluation Tool (SWEET) model development.

## 1.1 TM 4 Purpose and Scope

TM 4 summarizes the methodology for screening and evaluating biogas train enhancements, the technologies evaluated, and how these alternatives were ranked to determine which would move forward in the SWEET analysis. Biogas train enhancements generally fall into three categories: gas treatment, gas storage, and increased gas production. Those alternatives for gas treatment and storage are necessarily linked to the alternative power production options selected under Task 3 and summarized in TM 3. Codigestion is compatible with the stabilization alternatives selected under Task 2 and summarized in TM 2, but a range of co-digestion possibilities were explored under Task 4 and are described herein.

Recommended technologies and co-digestion operating schemes selected under this task will be advanced for further analysis and will be combined with the solids-handling and waste heat alternatives developed under Tasks 2, 3, and 5. Screening and ranking of technologies was performed in a workshop on September 19, 2017, with EWA staff. Meeting minutes from this workshop are provided as Attachment A.

## 1.2 Background Information

This TM is based on the conclusions developed in TM 1, which addressed the baseline energy profiles and projections, established a mass balance for the solids-handling system, and evaluated sludge flows and loads projections performed under the PMP. Where preliminary calculations were performed, the baseline data were used in evaluation. As described in Section 1.1, screening and evaluation of solids-processing technologies is described in TM 2, while screening and evaluation of alternative power production technologies is described in TM 3. Only those alternatives for biogas train enhancement that are compatible with technologies selected under Tasks 2 and 3 were evaluated under Task 4.

Additional information regarding EWA's experience with co-digestion is included in a TM written by Trussel Tech (Attachment B) that summarizes EWA's experience with alternative fuels codigestion to date, includes a literature review of alternative fuels codigestion, and presents process monitoring recommendations (Noelte 2017).

# Section 2: Identification and Screening of Technologies for Gas Treatment

This section describes potential gas treatment technologies, including gas treatment for internal-combustion (IC) engines and biogas upgrading for pipeline injection or vehicle fuel, followed by a fatal-flaw screening of gas treatment and rankings of gas treatment technologies.

## 2.1 Gas Treatment for Internal-Combustion Engines

Four 750-kilowatt (kW) IC engines are currently operated on raw biogas; however, EWPCF typically only runs two engines at a time due to air permit restrictions (discussed in TM 6). When excess biogas is available, it can be sent to the thermal dryer, where it is blended with natural gas (NG). This section discusses gas treatment options that could improve IC engine lifespan and reduce the frequency of maintenance activities for both the engines and thermal dryer.

#### 2.1.1 Gas Conditioning

Biogas typically contains methane (CH<sub>4</sub>), carbon dioxide (CO<sub>2</sub>), water vapor, hydrogen sulfide (H<sub>2</sub>S), ammonia (NH<sub>3</sub>), nitrogen (N), volatile organic compounds (VOCs), siloxanes, and trace amounts of other components. Some of these compounds can harm an IC engine and must be removed before combustion. For example, H<sub>2</sub>S can cause engine corrosion, and siloxanes oxidize during combustion to form silica particles that can damage an engine. Additionally, the combustion of some compounds, such as H<sub>2</sub>S, produces harmful and regulated air pollutants.

Gas treatment system design is driven by raw biogas flowrate, raw biogas quality, and post-treatment requirements. Post treatment requirements are dependent on fuel end use (IC engines, IC engines combined with exhaust treatment, pipeline injection, and direct vehicle fueling); however, all options require low H<sub>2</sub>S and siloxane concentrations and minimal water content. Raw biogas quality characteristics at EWPCF are presented in Table 2-1. Components included in the table are H<sub>2</sub>S and three of the most common siloxane species (D3, D4, and D5). The data presented in Table 2-1 are from two gas samples taken in 2011 and 2012.

Table 2-1. Raw Biogas Quality at EWPCF						
Sample Date H <sub>2</sub> S D3 Siloxanes D4 Siloxanes D5 Siloxanes (ppbv) (ppbv)						
December 15, 2011	139	18.4	115	734		
January 23, 2012	125	20.5	433	4,480		
Average	132	19.5	274	2,607		

ppbv = parts per billion by volume; ppmv = parts per million by volume.

The H<sub>2</sub>S concentrations are relatively low for biogas, but the observed concentrations still exceed most IC engine inlet specifications, the recommended value for compressed NG (CNG) vehicle fuel (SAE J1616), or the California Rule 30 H<sub>2</sub>S limit for pipeline injection. Additionally, even though total siloxane concentrations are relatively moderate for biogas, the raw biogas does not meet most IC engine fuel specifications, siloxane inlet requirements for selective catalytic reduction (SCR), or the California Rule 30 siloxane limit for pipeline injection.

It should also be noted that modifications to upstream biogas-producing systems may alter raw biogas quality. For example, thermophilic digestion may increase siloxane concentrations, and additional high strength waste quantities may increase H<sub>2</sub>S and NH<sub>3</sub> concentrations. If a Cambi thermal hydrolysis processing system is added upstream, significant concentrations of NH<sub>3</sub> may be present in the biogas.

A biogas conditioning system should be designed to meet all the fuel quality requirements for the selected alternative for biogas utilization; partial biogas treatment is not recommended. Typically, biogas conditioning systems include H<sub>2</sub>S, moisture, and siloxane removal and compression. Gas conditioning systems can either be engineered in separate components or provided as a whole system by a single equipment vendor, such as Unison Solutions or DMT Clear Gas Solutions. Individually specifying components often allows the design engineer to provide a more flexible layout that can be tailored to space requirements and maintenance access. Packaged systems can be desirable since treatment steps are highly codependent. Figure 2-1 shows an example of a gas conditioning system located at the Santa Rosa Laguna Treatment Plant. A process flow diagram for a sample gas conditioning system is presented in Figure 2-2.

Figure 2-1. Gas conditioning system at the Santa Rosa Laguna Treatment Plant, including H<sub>2</sub>S removal vessels, siloxane removal vessels, and chillers

Figure 2-2. Process flow diagram for a typical gas conditioning system. Configurations may vary, depending on equipment suppliers and treatment needs.

H<sub>2</sub>S removal is typically the first step in a biogas conditioning system. H<sub>2</sub>S is removed using an iron-oxide media, which operates best at ambient temperatures and high moisture content (saturated gas). Thus, raw biogas can be sent through H<sub>2</sub>S removal vessels before moisture removal or compression. Multiple types of H<sub>2</sub>S removal media are currently available, including iron sponge, SulfaTreat, and granular iron hydroxide. H<sub>2</sub>S removal media must be replaced regularly, which incurs additional operating and maintenance costs. Lifespan and maintenance requirements vary among the different media types. H<sub>2</sub>S removal systems are sized based on biogas flow rate and the biogas H<sub>2</sub>S concentration. At least two vessels are recommended so that one vessel can be taken offline during media removal or maintenance. Multiple vessels may be placed in series to treat biogas with high H<sub>2</sub>S concentrations.

NH<sub>3</sub> removal may be required if significant quantities of NH<sub>3</sub> are detected consistently in the biogas. In this case, NH<sub>3</sub> removal vessels would be placed downstream of the H<sub>2</sub>S removal vessels. NH<sub>3</sub> concentrations are often not high enough to warrant specialized removal vessels, and NH<sub>3</sub> can be effectively removed via carbon adsorption in the downstream siloxane removal vessels. NH3 in the biogas increases nitrogen oxide (NO<sub>x</sub>) emissions in IC engines. After passing through the H<sub>2</sub>S removal vessels, the biogas pressure must be increased and moisture must be removed because siloxane removal systems require a dry gas. Gas pressure must also meet the inlet requirements of the selected utilization alternative. Water is removed from the wet biogas through a moisture removal system that cools the biogas to condense water vapor; liquid water can then be drained and mist can be removed through a moisture separator. Gas pressure can be increased with blowers or compressors, depending on the desired outlet pressure. Compression increases the biogas temperature above the allowable inlet temperature for the downstream activated carbon media. A gas cooling heat exchanger is required after the pressure is boosted; the cooled biogas must then be reheated slightly before entering the siloxane removal system. The reheat step aims to return the biogas to ambient temperature and raise the temperature approximately 20 degrees Fahrenheit above the dew point to prevent condensation. Cooling and reheating can be achieved through a series of heat exchangers or via a single dual-core heat exchanger.

The most common siloxane removal method is adsorption via activated carbon media, which has microscopic pore spaces and a resulting high surface area to particle size ratio. This high ratio makes activated carbon an effective media for adsorbing molecular contaminants. The media typically becomes exhausted after 3 to 6 months and must be replaced regularly, incurring additional operating and maintenance costs. Like H<sub>2</sub>S removal, at least two vessels are recommended so that one vessel can be taken offline during media removal or maintenance. Multiple vessels may be placed in series to treat biogas with high siloxane concentrations and to avoid siloxane breakthrough that can harm downstream equipment. Particulate filters are usually installed downstream to capture any activated carbon particles that become suspended in the biogas.

#### 2.1.2 Gas Conditioning and Exhaust Treatment

If modifications to the existing IC engine operation are made, such as increased fuel usage or output above the current air permit limitations, an oxidation catalyst may be required to meet regulatory exhaust limits for carbon monoxide, which are discussed in greater detail in TM 6.A survey of several leading manufacturers of exhaust treatment equipment indicates that to meet exhaust emission requirements, biogas fuel must be treated prior to combustion to limit sulfur species to no more than 20 ppmv and siloxanes to no more than 20 ppbv or non-detect limits. These values are much lower than the raw biogas concentrations presented in Table 2-1.

Prior to reviewing the air permit, SCR systems to meet NO<sub>x</sub> limits were previously considered; however, they are not necessary to meet the permit requirements. In addition, installing an SCR system for exhaust treatment would be cost prohibitive as the Power Building would need to be replaced due to space

constraints and a relatively large footprint. On the fatal flaw criteria of compatibility and available space, SCR exhaust treatment fails the fatal flaw filter and will not be carried forward as an alternative.

## 2.2 Biogas Upgrades for Pipeline Injection or Vehicle Fuel

Biogas upgrading produces biomethane, a renewable NG substitute, which can be used as vehicle fuel in place of CNG or can be injected into a utility NG pipeline. These two biomethane end uses are described further in TM 3. Biogas upgrading first involves gas compression and gas conditioning to remove moisture, H<sub>2</sub>S, and siloxanes from the raw biogas, similar to conventional gas conditioning processes described in Section 2.1.1. After contaminants are removed from the gas, the gas goes through a separation process to remove CO<sub>2</sub>. The resulting product is a CH<sub>4</sub>-rich process gas commonly referred to as biomethane, or renewable NG. Separation systems can be designed to achieve various levels of biomethane purity, up to 99+ percent CH<sub>4</sub>. The CO<sub>2</sub> leaves the system in a CH<sub>4</sub>-lean tail gas consisting of primarily CO<sub>2</sub> with up to 30 percent of the total biogas CH<sub>4</sub> depending on the gas separation technology used. Tail gas is typically wasted using a flare or thermal oxidizers and may require a supplemental NG feed to help the tail gas combust.

Several biogas separation technologies are available, including membranes, pressure swing adsorption, and water solvents. Figure 2-3 shows an example biogas upgrading system provided by Unison Solutions that utilizes membrane separation. Other typical biogas separation technology manufacturers include Air Liquide, Guild Associates, Greenlane Biogas, and DMT Clear Gas Solutions. These manufacturers typically supply flange-to-flange packaged solutions and design and fabricate the systems in-house. For one of these flange-to-flange systems, the client and design engineer provide a performance specification in which the inlet gas and desired product gas characteristics are described. At EWPCF, a biogas upgrading system specification in a pipeline injection application would include the product gas requirements to meet the standards of California Rule 30. EWA and BC have identified a San Diego Gas & Electric NG pipeline that runs to the north of the plant to potentially tie into if a pipeline injection alternative is selected. TM 3 provides more information on product gas requirements for pipeline injection and direct vehicle fueling.

Figure 2-3. Biogas upgrading system at San Mateo WWTP (California) using Unison's BioCNG system, which includes H<sub>2</sub>S removal, moisture removal, compression, siloxane removal, and membrane separation

## 2.3 Fatal-Flaw Screening and Evaluation of Gas Treatment

The power production alternatives presented in Section 2 were first screened using four fatal-flaw criteria, which were applied uniformly across all technologies. The four criteria developed in conjunction with EWA staff include the following:

- At least one successful North American installation of technology: There must be at least one full-scale installation of the technology at a wastewater treatment plant (WWTP) in North America.
- At least one successful installation and operation in a facility of similar size: The technology should be sufficiently developed that it is applicable at a facility of comparable size to EWPCF to ensure compatibility.
- Available space: The technology must be accommodated within the limited available footprint at EWPCF.
- Compatibility with plant site and any existing equipment: The technology must be capable of being integrated into the existing EWPCF infrastructure.

For an alternative to be considered for the ranking process, the alternative must pass all four fatal-flaw criteria. The results of the fatal flaw screening exercise are presented in Table 2-2 and discussed in Section 2.3.

Table 2-2. Gas Treatment Fatal-Flaw Evaluation					
Technology Maturity Successful Operation Available Space Compatibility					
Gas conditioning	Pass	Pass	Pass	Pass	
Gas conditioning + exhaust treatment	Pass	Pass	Fail	Fail	
Biogas upgrading	Pass	Pass	Pass	Pass	

Alternatives that passed the fatal-flaw filter were further evaluated and ranked based on both economic and non-economic screening criteria. The BC team worked with EWA staff to develop a series of evaluation criteria that reflect the project goals, EWA's values, and EWA's general operational practices. Criteria weights were assigned in Workshop 2 with EWA staff. Criteria and weightings are presented in Table 2-3.

Table 2-3. Criteria and Weight for Technology Screening				
Criterion	Description Scoring Description			
Proven technology performance	Proven and reliable technology with same configuration intended at Encina Long successful operating track record	Low score indicates no successful large-scale operating installations in North America or Europe, no successful demonstration-scale installations in North America or Europe, and unknown safety or reliability record High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration > 5 years, and vendors in western United States	20%	
Minimize life-cycle costs	Qualitative metric of program cost Capital and O&M costs based on existing EWA data or similar experience at other WWTPs Potential revenues from sales	Low score indicates high capital cost to build onsite facilities, high O&M costs, and low energy recovery efficiency High score indicates low capital cost to build onsite facilities, low O&M costs, and potential revenue	10%	

Table 2-3. Criteria and Weight for Technology Screening				
Criterion	Description	Scoring Description	Weight	
Energy/resource recovery	Recovery of renewable energy	Low score indicates high energy requirement for onsite technology, technology does not recover energy as biogas, and low-efficiency recovery of renewable energy High score indicates a higher electrical efficiency	25%	
0&M impacts	Impacts to existing plant O&M staff levels Complexity of new technology O&M and control systems Reliability of new technology (potential downtime) Minimal impacts to plant safety	Low score indicates more 0&M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and newer hazards  High score indicates reduction in 0&M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new hazards	10%	
Environmental impacts	Impacts to carbon footprint and air permitting	Low score indicates high carbon footprint for technology, and new permitting for environmental regulatory requirements  High score indicates low carbon footprint for technology, reduced pollutant emissions, and no additional permitting for environmental regulatory requirements	15%	
Community and stakeholder impacts	Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise, and traffic  Assess impacts to partner agency issues/values as well as local planning codes and requirements	Low score indicates nuisance factors for onsite technology are difficult to mitigate High score indicates nuisance factors can be mitigated at plant site	10%	
Project site compatibility  Assess compatibility of technology with available plant footprint Incorporation into existing treatment process		Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant  High score indicates available footprint for new facilities and maintains space for future facilities, ease of integration with existing processes and facilities	10%	

Table 2-4 shows the scoring results for the gas treatment technologies that passed the fatal-flaw filter. The scores for each alternative were also developed with EWA staff in Workshop 2. All alternatives passed the fatal-flaw filter. The rationale behind the scoring for each technology area is described below.

Table 2-4. Gas Treatment Technologies Scoring Evaluation				
Criterion	Gas Conditioning	Gas Conditioning + Exhaust Treatment	Biogas Upgrading	
Proven technology performance	5	4	2	
Minimize life-cycle costs	3	4	4	
Energy/resource recovery	4	5	4	
0&M impacts	4	3	4	
Environmental impacts	3	4	5	
Community and stakeholder impacts	4	5	5	
Project site compatibility	5	4	4	
Weighted score	4.05	4.25	3.85	

Biogas upgrading is still considered an emerging technology and has fewer large-scale installations and less established equipment manufacturers. Biogas upgrading alternatives can bring in potential revenue from Low Carbon Fuel Standard (LCFS) and Renewable Identification Number (RIN) credits generated for producing renewable fuel, currently valued between \$1 and \$3 per diesel gallon equivalent produced (every 1 standard cubic foot per minute [scfm] of biogas produces approximately 5 diesel gallon equivalents of fuel per day) in addition to the value of the fuel itself. However, the biogas upgrading alternatives have relatively high capital costs when compared with an engine project, thus, lowering the life-cycle cost score to a 4. The approximate biogas production during the baseline period, potential quantity of renewable NG that can be generated, and potential RINs values associated with biogas upgrading are presented in Table 2-5.

Table 2-5. Biogas Upgrading Potential Assuming Existing Baseline Biogas Production <sup>a</sup>			
Characteristic	Value		
Biogas Production, cfm	500		
Methane recovery, %	99.5		
DGE/day	3,000		
RINs/day	5,000		
\$Revenue/day	12,000		
\$Revenue/year	4.4M		

a. Assumes 95% biogas upgrading uptime, RINs value of \$2/RIN and LCFS value of \$0.70/DGE.

DGE = diesel gallon equivalent

Biogas upgrading received the highest score for environmental impacts because biomethane replaces anthropogenic fuels with a biogenic, fully renewable fuel.

# **Section 3: Identification and Screening of Technologies** for Gas Storage

Biogas storage is used to buffer or control variations in biogas production and maintain steady output from IC engines or other biogas uses. EWPCF has no dedicated biogas storage equipment; however, differences between biogas production and utilization in the existing IC engines are controlled by NG blending. The primary benefit of biogas storage at EWPCF is reducing the need for NG blending and the associated utility costs. Stored biogas from periods of excess production can be used to replace NG in times of low biogas production.

Because EWPCF's current gas management system and NG blending strategy provides effective control of the IC engines and helps utilize nearly all produced biogas, gas storage alternatives do not offer significant savings. It is noted that although NG blending increases NG costs, it provides a greater decrease in power costs due to increased IC engine output.

### 3.1 Identification of Applicable Technologies

This section identifies two biogas storage options—a piston-type gas holder and a dual-membrane type gas holder on the top of a digester. Both types have been in service for many years.

#### 3.1.1 Piston-Type Gas Holder

The piston-type gas holder has a simple and linear relationship between piston height and stored gas volume. These types of gas holders are proven in the industry and provide reliable and robust storage. Figure 3-1 shows a piston-type gas holder that was installed at the San José-Santa Clara Regional Wastewater Facility (SJSCRWF) and Table 3-1 presents the pros and cons of this type of gas holder.

Figure 3-1. Piston-type gas holder installed at SJSCRWF with 50,000 cubic feet of active storage

Table 3-1. Advantages and Disadvantages of Piston-Type Gas Holder			
Advantages	Disadvantages		
30-year life	High capital cost		
Fixed storage pressure	Dry seal replacement at 15 years <sup>a</sup>		
Direct/visual measurement of stored volume	Recoat at 15 years		
Reliable operation/signal for blending control			

a. Industry experience shows that dry seal service life can be as long as 29 years, but replacement is recommended after 15 years.

Typically, dedicated gas storage tanks are sized for 10 to 60 minutes of biogas storage. Based on the plant's biogas production, this could result in a new 30- to 50-foot-diameter tank for gas storage, which is not compatible with the plant's available space and, therefore, does not pass the fatal-flaw filter.

#### 3.1.2 Dual-Membrane Gas Storage

Gas storage can also be accomplished by installing a dual membrane above the concrete walls of a digester or on a slab on grade. With a dual-membrane storage system, the outer air membrane remains inflated in a fixed position while the inner membrane moves freely as biogas is stored or removed for use downstream. Figure 3-2 shows an example of a dual-membrane gas holder.

Figure 3-2. Dystor® gas holder system from Evoqua Water Technologies example installation

The dual-membrane type gas holders first came on the market in about 1987. However, dual-membrane gas holders with control signals that represent the gas production/consumption relationship are relatively new and have been in service for only about the last 5 years.

A dual-membrane gas storage system can be installed on top of one of the smaller digesters at EWPCF and can provide a feasible solution if gas storage and a digester cover are required. When installed as a digester cover, the dual-membrane system can double or triple the existing biogas storage space of one of the smaller digesters. Table 3-2 presents the pros and cons of this type of gas holder.

Table 3-2. Advantages and Disadvantages of Dual-Membrane Gas Holder		
Advantages	Disadvantages	
Low capital cost	Membrane replacement at 10–20 years <sup>a</sup>	
Adjustable operating pressure	Level detection is unproven, developing, and different for each manufacturer	
Greater volume, if needed	Less robust than piston-type gas holder	
	Limited fill/draw rates	
	Requires continuous electric blower operation	
	Digester-mounted membranes are difficult to access for repairs	

a. Industry experience shows that membrane service life can be as short as 7 years.

One of the smaller existing EWPCF digesters can be retrofitted to a dual membrane gas holder, which meets the available space and compatibility requirements of the fatal-flaw filter. Dual membrane gas holders have been employed as digester covers at multiple moderate-sized WWTPs, including Yakima Regional WWTP in Washington and the City of Mansfield WWTP in Ohio. As a result, dual membrane gas holders also meet the successful installation requirements of the fatal-flaw filter. Economics will ultimately determine whether a dual membrane gas holder is a feasible gas storage option at EWPCF. If NG savings from better metering of stored biogas can be shown to exceed the capital and operating costs of dual membrane storage, this alternative may be feasible moving forward. Dual membrane gas holders will be further considered in the SWEET analysis.

## 3.2 Fatal-Flaw Screening and Evaluation of Gas Storage

The same four fatal-flaw criteria presented in Section 2 were applied to the gas storage alternatives. These results are presented in Table 3-3. If gas storage is required, one of the smaller digesters would be retrofitted to serve for the base tank of a dual membrane gas holder.

Table 3-3. Gas Storage Fatal-Flaw Evaluation				
Technology	Technology Maturity	Successful Operation	Available Space	Compatibility
Piston-type gas holder	Pass	Pass	Fail	Fail
Dual membrane gas holder	Pass	Pass	Pass	Pass

#### Section 4: Increased Gas Production: WAS Pretreatment

One way to increase biogas production from anaerobic digestion is to condition WAS to make it more readily biodegradable with WAS pretreatment technologies. WAS pretreatment technologies work on different principles to disintegrated cell walls. Some of these technologies have been discussed in TM 2. Technologies screened out in TM 2 were not considered further in this evaluation unless they presented a unique application. Many WAS pretreatment technologies are in research stage and are not commercially available. Those technologies were not included in this evaluation.

WAS pretreatment technologies evaluated in this section include:

- Ultrasonic pretreatment
- Electro kinetic disintegration
- Thermal hydrolysis
- Mechanical pretreatment

Brief introductions and a fatal-flaw screening evaluation of the WAS pretreatment technologies are provided in the following subsections.

## 4.1 Identification of Treatment Technologies for WAS Pretreatment

The BC team first identified possible WAS pretreatment technologies for incorporation at EWPCF. These are discussed below.

#### 4.1.1 Ultrasonic Pretreatment

The principle of ultrasonic treatment relies on the cavitation generated by probes to disintegrate cell walls and reduce particle size, making WAS easier to digest during the anaerobic digestion process. There are a few commercial ultrasonic pretreatment technologies available, such as Sonix™ by Sonico and Sonolyzer™ by Ovivo.

The key components of these ultrasonic pretreatment technologies are similar, typically include a reactor, probes, and a control unit. A schematic depicting the key components of a Sonolyzer™ unit is shown in Figure 4-1.

Figure 4-1. Schematic of key components of a Sonolyzer™ unit

Courtesy of Ovivo

Ultrasonic pretreatment technologies have been tested at bench scale and pilot scale and shown to increase volatile solids (VS) reduction and increase biogas production. However, no full-scale installation has been reported at the time of this evaluation.

#### 4.1.2 Electrokinetic Disintegration

Electrokinetic disintegration technology uses high-voltage of electricity to rupture the cell membranes. Two electrokinetic disintegration technologies have been developed, including BioCrak® and OpenCEL™. The OpenCEL™ system is currently not available as the company filed for bankruptcy a few years ago.

BioCrack® is an electrokinetic disintegration process offered by Vogelsang. During the process, a high-voltage field is generated in the reactor, which breaks up organic matter and bacteria in WAS and makes it easier to digest during the anaerobic digestion process. A BioCrack® system consists of several modules. Each module is made up of three major components, including a housing, electrode, and electrode head, as shown in Figure 4-2. The number of modules in each system is determined by the characteristics of the sludge and digestion process.

Figure 4-2. Section view of a BioCrack® module

Courtesy of Vogelsang

BioCrack® has more than 40 installations, most of which are in biogas plants for silage digestion in Europe. There is no reported municipal WWTP BioCrack® installation in North America.

#### 4.1.3 Thermal Hydrolysis

The thermal hydrolysis process (THP) solubilizes the organic fraction of the sludge and break the cell membranes by submitting it to elevated temperature and pressure. Manufacturers of thermal hydrolysis systems include Cambi, Veolia (BioThelys™ and Exelys™), and Ovivo (LysoTherm™). Cambi, Biothelys, and Exelys were evaluated for processing both WAS and primary sludge, which is discussed in TM 2. Within this task, these technologies were evaluated for a WAS-only application.

The LysoTherm<sup>™</sup> thermal pressure hydrolysis system is distributed by Ovivo in North America. It is a continuous process that uses thermal pressure for WAS pretreatment. Sludge is fed into the LysoTherm<sup>™</sup> by means of a feed pump and pressurized between 5 and 10 bar. The sludge is then heated to 160 to 175 degrees Celsius (°C) using thermal oil and held at that temperature for 30 to 60 minutes. Sludge is then cooled and fed to the digesters. Recovered heat is used to preheat the incoming sludge flow. A schematic showing the process flow of the LysoTherm<sup>™</sup> process is shown in Figure 4-3.

Figure 4-3. Schematic of LysoTherm™ process

Courtesy of Ovivo

The LysoTherm<sup>™</sup> process has several full-scale installations in Europe but no reported installation in North America at the time of this evaluation.

#### 4.1.4 Mechanical Pretreatment

Mechanical pretreatment technologies rely on high pressure and cavitation for cell destruction. The sludge is homogenized, pressurized, and forced through a nozzle, causing cell rupturing. Mechanical pretreatment systems include Crown™ Sludge Disintegration (Evoqua) and MicroSludge™ (Paradigm Environmental Technologies). The MicroSludge™ system is currently not available as Paradigm Environmental Technologies Inc. filed for bankruptcy a few years ago.

The Crown<sup>™</sup> disintegration system is a mechanical WAS pretreatment process distributed in North America by Evoqua. The main principle is cavitation created by operating the system at 12 bar and pumping through a pressure reduction nozzle (the disintegrator). Cavitation occurs in the second part of the nozzle as a result of the sudden pressure drop. Key components of the Crown<sup>™</sup> system include a homogenizer, disintegrator nozzle, pressurization pump, recirculation tank, and discharge pump. An installation of the Crown<sup>™</sup> system is illustrated in Figure 4-4.

Figure 4-4. Crown™ disintegration system at Rosedale WWTP, North Shore, New Zealand

The Crown™ system has been installed in approximately 20 facilities, most of which are in Germany. No full-scale installation in North America has been reported at the time of this evaluation.

### 4.2 Fatal-Flaw Screening of WAS Pretreatment Technologies

The WAS pretreatment technologies presented in Section 4.1 were screened using four fatal-flaw criteria, which were applied uniformly across all technologies. The four criteria developed in conjunction with EWA staff include the following:

- At least one successful North American installation of technology. There must be at least one full-scale installation of the technology at a WWTP in North America.
- At least one successful installation and operation in a facility of similar size. The technology should be sufficiently developed that it is applicable at a facility of comparable size to EWPCF to ensure compatibility.
- Available space. The technology must be accommodated within the limited available footprint at EWPCF.
- Compatibility with plant site and any existing equipment. The technology must be capable of being integrated into the existing EWPCF infrastructure.

For an alternative to be considered for the ranking process, the alternative must pass all four fatal-flaw criteria. The fatal-flaw screening results are presented in Table 4-1.

Table 4-1. WAS Pretreatment Technologies Fatal-Flaw Evaluation					
Technology	Technology Maturity	Successful Operation	Available Space	Compatibility	
Sonolyzer™	Fail	Fail	Pass	Pass	
Sonix™	Fail	Fail	Pass	Pass	
BioCrack®	Fail	Fail	Pass	Pass	
OpenCEL™	Fail	Fail	Pass	Pass	
Cambi™: WAS only	Pass	Pass	Pass	Pass	
Exelys™: WAS only	Fail	Pass	Pass	Pass	

Table 4-1. WAS Pretreatment Technologies Fatal-Flaw Evaluation							
Technology	Technology Technology Maturity Successful Operation Available Space Compati						
BioThelys™: WAS only	Fail	Pass	Pass	Pass			
LysoTherm™	Fail	Fail	Pass	Pass			
Crown™	Fail	Fail	Pass	Pass			
MicroSludge™	Fail	Fail	Pass	Pass			

#### 4.3 Conclusions

Cambi<sup>™</sup> THP is the only WAS pretreatment technology that passed the fatal-flaw screening. Other technologies failed because of lack of technology maturity and/or successful operation in North America. Cambi<sup>™</sup> THP was evaluated as one of the solids stabilization technologies in TM 2 and was selected for further evaluation. It is important to note that in a WAS-only scenario, Cambi does not produce Class A biosolids. Nevertheless, WAS-only Cambi THP is being carried forward for further analysis.

## **Section 5: Increased Gas Production: Co-digestion**

Another means of increasing gas production is via the importation of HSW, such as fats, oil, and grease (FOG) and pre-processed food waste. These wastes can be co-digested with sludge to increase biogas production and potentially digester performance. This opportunity is discussed in detail below.

Anaerobic digestion is currently at the nexus of two important State of California goals: organics diversion from landfill and increased renewable energy and fuels generation. Organics diversion from landfill is the primary initiative in the State's 75 percent solid waste recycling goal and is backed up by new regulations, which require source separation and collection of organics (Assembly Bill 1826 and Senate Bill [SB] 1383). The goal of SB 1383 is to reduce CH<sub>4</sub> emissions from landfill and further promote/require organics diversion (Short-Lived Climate Pollutants Act, California Air Resources Board). The primary alternatives for organics management are anaerobic digestion and composting—of which anaerobic digestion is the only process that offers energy recovery potential. Over the next few years, California's municipal solid waste haulers, material recovery facilities, and landfills will need to develop collections, processing, and energy recovery infrastructure to address these State legislations and goals.

Existing WWTPs are uniquely positioned to play a role in the new organics marketplace. Whereas waste management facilities do not typically have anaerobic digesters, most WWTPs already operate digesters (with energy recovery facilities) and may have additional capacity for organic wastes beyond municipal wastewater solids. In addition, WWTPs are generally able to effectively manage the digestate- and nutrient-rich residuals in a beneficial way. Many WWTPs are already using available digestion and energy capacity for co-digestion of FOG and liquid organic HSW from industry. Tipping fees for waste acceptance and increased DG production for energy generation make co-digestion economically viable and potentially attractive to public agencies operating WWTPs. Acceptance of organics diverted from landfills would follow the same model, but perhaps with improved economies of scale due to the large and steady demand created by the landfill/organics regulations.

## 5.1 Co-digestion Feedstocks and Typical Characteristics

There are three general categories of co-digestion feedstocks: 1) HSW and FOG; 2) source-separated organics (SSO)/food waste; and 3) the organic fraction of municipal solid waste (not SSO). FOG is already being received by EWA in a quantity of approximately 261,000 gallons per month. Recently, EWA has completed trials, collecting brewery waste and co-digesting it. As part of the planning process, EWA and the BC team have started discussions with local waste haulers about obtaining a pre-processed SSO.

This section describes the characteristics of the pre-processed food waste that would be anticipated for EWA's facility. The analysis assumes that EWA will continue to receive the same amount of FOG as it does now. However, for mesophilic digestion, there will not be enough capacity with the current configuration of using Digesters 4 through 6, therefore EWA would need to stop accepting FOG in the future. As FOG is a known feedstock and discussed in TM 1 as part of existing conditions, this section focuses mainly on the pre-processed SSO characteristics.

The pre-processed SSO is expected to range in solids concentration from 12 to 15 percent, and may vary in pH ranging from 3 to 7, with the expected pH value being around 5. As part of the development of the pre-processed SSO receiving program, it is assumed that EWA will develop standards for quality related to minimum screen size, debris removal rates, and presence/absence of manufactured inerts. Generation of the pre-processed SSO will be accomplished by a third party, off site. Raw SSO will be processed into an organic feedstock, nearly free of contaminants, pulped, extruded, and/or slurried into a pumpable liquid. Attachment C summarizes the SSO requirements that the Sanitation Districts of Los Angeles County (LACSD) has developed for its pre-processed SSO receiving program. Other pertinent requirements include recent

requirements developed by CalRecycle under its new composting regulations (California Code of Regulations [CCR] Title 14, Chapter 3.1, Section 17868), which is included to provide some guidance on physical contamination requirements, which EWA may wish to incorporate (Attachment C). Viewed as a whole, these can be used as a guide for the desired feedstock quality for the partners that will provide EWA with preprocessed SSO.

## 5.2 Initial Estimation of Acceptable Co-Digestion Volumes

Estimation of acceptable co-digestion volumes was completed assuming existing sludge production values as well as 2030 project flows and loads. For these analyses, the amount of FOG was held constant at existing conditions at 8,700 gallons per day (gpd). The amount of acceptable co-digestion volumes was determined based on the process limiting factor, either hydraulic loading rate (HLR) or organic loading rate (OLR). For the initial estimates, only pre-processed SSO was considered, assuming at the lower end of the range at 12 percent total solids (TS) and 85 percent VS. Table 5-1 summarizes the existing and projected solids loadings.

Table 5-1. Summary of Annual Average Solids Conditions						
B'	Existing			2030		
Digestion Feedstock	Flow (gpd)	%TS	%VS	Flow (gpd)	%TS	%VS
Primary sludge	140,282	4.1%	87%	179,596	4.1%	87%
TWAS	60,232	5.6%	80%	79,835	6%	80%
FOG	8,700	5.5%	80%	8,700	5.5%	80%
SS0		12%	85%		12%	85%

TWAS = thickened waste activated sludge

Furthermore, co-digestion capacity was analyzed under several conditions: mesophilic, thermophilic conventional, thermophilic 10-day, and THP. They were further analyzed with and without the small digesters, except for THP. The addition of the small digesters in each scenario provided additional capacity. The HLR and OLR were varied depending on the scenario reviewed. Table 5-2 provides the process values used for each of the stabilization scenarios.

Table 5-2. Process Data for Each Solids Stabilization Scenario					
Condition	Digester Volume (MG) <sup>a</sup>	Digester Volume with Small Digesters (MG) <sup>a</sup>	nall Digesters HLR (d)		
Mesophilic	4.1	5.0	15	0.18	
Thermophilic: 15-day	4.1	5.0	15	0.35	
Thermophilic: 10-day	4.1	5.0	10	0.35	
THP	4.1		12	0.40	

a. Digester volume assumes service conditions, meaning the largest is out of service.

lb-VS/ft<sup>3</sup> = pounds volatile solids per cubic feet; MG = million gallons.

The OLR and HLR (expressed as VS equivalent load) were determined based on the loading rate and total digester capacity. The available capacity was determined by taking the difference between the actual OLR and the maximum OLR (Table 5-2) for OLR process as well as the difference between the actual HLR and the minimum HLR (Table 5-2). These differences became the available capacity. The process limiting factor was determined based on which factor had less capacity. For instance, in 2030, THP was organically limited (120,000 pounds VS per day [lbs-VS/day]), meaning that there was more hydraulic capacity estimated (157,000 lbs-VS/day).

This organic loading equates to a volume of preprocessed SSO based on the assumed 12 percent TS and 85 percent VS. Assessing capacity under service conditions and peak month loads is a conservative approach that will evaluate the worst-case scenario (least amount of capacity). In addition to the conservative approach, a less conservative approach was evaluated and are presented below. The less conservative approach assumes that all digesters are online and the flows are under peak month conditions. Because these assessments are less conservative, there may be times when EWA would have to stop accepting FOG and SSO from the haulers. Both scenarios are presented because it allows EWA to make the decision, does EWA want absolute redundancy (first assessment) or have provisions in the contract allowing EWA to reject loads when these worst-case loads occur.

Based on historical, projected, and assumed data, an amount of SSO feedstock was determined based on peak month conditions (peaking factor of 1.23 was applied to annual average values). Assuming peak month configuration provides a conservative value for co-digestion feedstocks. Table 5-3 summarizes the capacity available for each of the stabilization scenarios.

Table 5-3. Results of Capacity Analysis Under Service Conditions <sup>a</sup>					
	Current		2030		
Condition	SSO (gpd)	With Small Digesters SSO (gpd)	SSO (gpd)	With Small Digesters SSO (gpd)	
Mesophilic	18,000	45,600	0	5,500	
Thermophilic: 15-day	18,000	78,000	0	5,500	
Thermophilic: 10-day	129,700	129,200	82,200	152,000	
THP	166,500	N/A	140,600	N/A	

a. Assumes SSO solids content of 12% TS. b. Digester volume is 4.1 MG. c. Digester volume is 5.0 MG.

As noted in Table 5-3 there is no capacity in the future for mesophilic digestion and 15-day thermophilic digestion. Under these conditions, there would not be enough capacity to treat the projected amount of sludge and FOG received under service conditions, unless Digesters 1 through 3, 5, and 6 are in service. Thermophilic operating in 10-day mode can accept approximately 82,200 gpd of SSO with only the two large digesters online. It can also accept 152,000 gpd with Digesters 1 through 5 online. This would result in an estimated biogas increase of approximately 1,100,000 standard cubic feet per day (scfd) and 2,100,000 scfd, respectively, assuming a biogas yield of 18 cubic feet per pound VS per day. Additionally, THP would yield an estimated biogas increase by 1,900,000 scfd from SSO.

Table 5-4 summaries the available capacity when all of the digesters are online under peak month conditions. These estimated capacities are less conservative and allows for acceptance of more HSW. Because all of the digesters (Digesters 1 through 6) are in service, as part of the contract with the waste haulers, stipulations need to be made for times when HSW cannot be received. As mentioned previously, the additional HSW results in additional gas production. Biogas production ranges from 1,000,000 scfd to 3,600,000 scfd additional biogas from SSO only.

Table 5-4. Results of Capacity Analysis Under Full Operational Conditions <sup>a</sup>					
	Current		2030		
Condition	SSO (gpd)b	With Small Di- gesters SSO (gpd) <sup>c</sup>	SSO (gpd) b	With Small Digesters SSO (gpd) <sup>c</sup>	
Mesophilic	78,200	103,600	50,900	76,400	
Thermophilic: 15-day	154,700	214,700	82,200	142,200	
Thermophilic: 10-day	242,500	292,000	215,200	264,700	
THP	295,400	N/A	269,500	N/A	

a. Assumes SSO solids content of 12% TS.

Based on the above assessments and engineering judgement, it is recommended that Mesophilic could accept 30,000 gpd of SSO. Also, the 15-day thermophilic scenario could receive 50,000 gpd, while the 10-day thermophilic and THP scenarios would accept 80,000 gpd of SSO. These recommended values consider both assessments and are more conservative than the peak month assessment but not as conservative as the under-service condition assessments. These values also consider truck traffic. In the case of thermophilic 10-day and THP, the truck traffic was limited to 13 trucks per day (6,000-gallon trucks), which results in a limit of 80,000 gpd of SSO.

Finally, another area for concern with the addition of outside feedstocks is the potential for NH<sub>3</sub> toxicity. This is a concern especially with THP, when the amount of total NH<sub>3</sub> nitrogen (NH<sub>3</sub>-N) is greater than 3,000 milligrams per liter (mg/L) (Gerardi 2003). Part of the co-digestion analysis reviews the amount of potential NH<sub>3</sub>-N released during the digestion process. As historical data for NH<sub>3</sub> were not available, values were assumed for typical sludge NH<sub>3</sub> content. To provide a more accurate analysis of the soluble and total nitrogen content, primary sludge, TWAS, digester, and FOG samples should be analyzed for total Kjeldahl nitrogen and soluble NH<sub>3</sub> content. The total NH<sub>3</sub>-N content may be an issue for THP at a 9 percent TS feed content. The NH<sub>3</sub>-N content was 3,208 mg/L and 3,085 mg/L for THP under service conditions at peak month for current and in 2030, respectively. Under full operational conditions the NH<sub>3</sub>-N values are higher at 3,358 mg/L and 3,276 mg/l for current and in 2030, respectively. Each of these conditions estimates NH<sub>3</sub>-N greater than 3,000 mg/L. This could cause NH<sub>3</sub> toxicity issues in THP; however, additional samples should be tested to confirm estimated and assumptions used in these analyses. Additionally, the reduced amount of SSO recommended previously would also alleviate this issue. Attachment D presents the co-digestion model calculations and assumptions.

b. Digester volume is 6.15 MG. c. Digester volume is 7.05 MG.

#### 5.3 Results of Initial Outreach to Feedstock Providers

Part of the project work includes understanding how much SSO is available in the market, and if the waste haulers processing it would be interested in bringing the SSO to EWPCF. A meeting was set up in September 2017 with the three major waste haulers in the EWA service area: Waste Management (WM), Republic Services, and EDCO. Others present at the meeting included representatives from EWA and BC.

The agenda started with providing the waste haulers with background information regarding EWA's current operations and capacity considerations. The evaluation for selecting the best biosolids process for EWA includes confirming that waste haulers could fill the volume capacity of whichever final biosolids process was selected. The consensus from the waste haulers was that if the capacity was there, the waste haulers would bring the material.

The waste haulers were then given an opportunity to share their plans for handling SSO diversion as organics are required to be diverted from landfills. As could be expected, the representatives were hesitant to share their goals and strategies with their fellow competitors in the room. However, each waste hauler indicated that they would reach out to EWA individually post-meeting to discuss further.

EWA then used the meeting to confirm its commitment to increasing organics loads. EWA highlighted the potential for a mutually beneficial public-private partnership, which would result in a public win with regional development addressing emerging organics diversion requirements. Each waste hauler expressed gratitude to EWA for taking the initiative to start conversations regarding organics waste diversion, and each waste hauler indicated that it would reach out to EWA separately to continue that conversation.

## **Section 6: Digester Gas Management and Dryer Control**

EWA's biogas production currently exceeds the permitted fuel input for the IC engines, even with the revised air permit (November 2017). Biogas to the engine is automated and controlled on pressure. Excess biogas is directed to the heat dryer. This practice makes use of the biogas and decreases NG purchase for the drying process. The control of biogas flow to the dryer is based on manual set points. In an effort to avoid drawing too much biogas to the dryer (and "starving" the engines), EWA operators typically set the dryer biogas flow rate lower than the actual available gas. As a result, some digester gas is wasted in the flare.

There are two solutions to this situation: 1) automate the dryer biogas flow; or 2) change the plant's approach to managing the set point. Automating the dryer biogas flow might take some additional SCADA programming and instrumentation, but most of the piping, valves and instruments are already in place. These programming upgrades should be considered for near-term implementation.

In the meantime, EWA can change its approach to the dryer biogas set point. Instead of setting a low flow, the plant can set a higher flow set point. The engines won't be "starved" if biogas production dips—the existing NG blending control scheme will kick in to maintain engine output. This overall approach would eliminate biogas flaring without increasing the plant's net purchase of NG.

## **Section 7: Conclusions and Next Steps**

Enhancements to the biogas train have been evaluated in this task. Options to provide gas treatment and gas storage, and improve biogas production that passed the fatal-flaw filter, will be combined with selected technologies screened in Tasks 2 and 3 for the solids and biogas use process areas. Once the full set of alternatives are developed, they will be evaluated on a net present value basis for further screening.

## Meeting Minutes

9665 Chesapeake Drive, Suite 201 San Diego, CA 92123

T: 858.571.8822 F: 858.571.8833

**Prepared for:** Encina Wastewater Authority

Project Title: Energy & Emissions Strategic Plan & Biosolids Management Plan Update

**Project No.:** 150871

Purpose of Meeting: Workshop #3 Date: September 19, 2017

Meeting Location: Encina Wastewater Authority Time: 12:30 – 4:00 PM

Minutes Prepared by: Jocelyn Lu, Brown and Caldwell

Attendees: Debbie Biggs, Encina JPA

Doug Campbell, Encina, JPA
Jimmy Kearns, Encina JPA
Mike Steinlicht, Encina JPA
Octavio Navarrete, Encina JPA
Scott McClelland, Encina JPA
Tucker Southern, Encina JPA

Adam Ross, Brown and Caldwell Hari Seshan, Brown and Caldwell Jocelyn Lu, Brown and Caldwell Scott Lacy, Brown and Caldwell

Scott Goldman, RMC

#### Attachments:

Workshop #3 Presentation Slides

#### **Decisions**

The following is a list of decisions made as a result of the meeting discussion:

BC will update conceptual layouts per discussion with EWA staff.

#### **Action Required**

The following is a list of actions required as a result of the meeting discussion:

- Scott L to send out an outlook invitation for a biweekly conference call for the Encina and BC team.
- Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.
- Adam to reach out to Tom to get information regarding the mixing analysis.
- Scott L to send a WEFTEC list to Encina and get their input.
- Hari to review the mass balance calculations and provide an explanation.
- Adam to confirm the specific CAMBI model for thermal hydrolysis with Tom.
- Adam to set a call between Kenny Klittich (BC) and Tucker (EWA) to discuss energy options.

#### Summary

Workshop #3 was held for the Encina Water Authority (EWA) Energy & Emissions Strategic Plan & Biosolids Management Plan Update. The purpose of this Workshop was to review pending administrative tasks and provide task updates. A summary of the discussion is provided below:

#### **Introductory Items**

BC started off the meeting by reviewing the schedule and goals for the meeting. The goals are to generate content and direction for the project team moving forward.

- This month, the Brown and Caldwell (BC) team will be:
  - Working on and finalizing TMs 2 and 3.
  - In October and November, BC will be developing SWEET alternatives and providing more clarity on how the pieces interact.
- Scott Lacy (Scott L) states that since the next workshop won't be until December, he'll send out a biweekly conference call invite for the team.
- ACTION: Scott L to send out an outlook invitation for a biweekly conference call for the Encina and BC team.

#### **Outstanding Data Requests**

BC reviewed outstanding data requests with EWA. They included:

- Cogen and solids systems drawings and engine cut-sheets
- Engine O&M services, intervals, and costs
- Dryer system drawings and cut sheets
- Copies of current air permits (SDAPCD and Title V)
- CEPT electrical demand discrepancies
  - Requesting information on why the electrical demand for CEPT changed from 1067 kWh/month prior to 2/1/16. After 2/1/16 it was either less than 650kWh/month or zero
- ACTION: Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.

There was a subsequent discussion on the heat dryer in the building. Mike Steinlicht (Mike) states that the dryer is in a steel fabricated building (not a brick and mortar), so there is opportunity there to expand the building to put in a second dryer.

#### Report Out on Meeting with Waste Haulers

BC met with the waste haulers earlier the same day. Below is a summary of the report out from the team. For the full minutes, please see the minutes for the Waste Haulers meeting.

- The waste haulers present at the meeting included representatives from Waste Management (WM), Republic Services, and EDCO.
- Scott M states that the question was posed to the waste haulers on how much organic food
  waste they could bring to the plant, and the consensus was that if the capacity was there,
  they would bring the material.
  - Adam Ross (Adam) agreed and stated that Encina will want to think about how much cushion they'd want to give themselves, and that should be taken into consideration on the volumes given to the waste haulers.
- There was also a discussion regarding vehicle fuel with the waste haulers.

• Adam presented 3 options to distribute vehicle fuel: (1) fueling station, (2) tube trailers, and (3) injecting it straight into the pipeline.

- 2 out of the 3 haulers expressed hesitation with on-site vehicle fueling.
- Adam states that when evaluating vehicle fueling in the SWEET model, the RIN credit would be discounted in terms of value and/or duration (leading to a more conservation evaluation).
- Scott L states that it would make sense to develop a range of capacities for the vehicle fueling option, to support both internal evaluation and provide a range for the haulers.
- Scott M asks if BC would want to be involved in the conversations with the haulers. Adam states that BC is interested, but to not let it delay a convenient meeting.
- Encina is beginning a food waste receiving pilot with Waste Management. WM is currently delivering 10,000 gallons per day, which will increase to 15,000 gpd over the next week.
  - o Deliveries are reported as 14% solids and no major issues so far

#### Report Out on Anaergia Meeting

BC and Encina provided an update on their respective discussions with Anaergia.

- Adam states that Anaergia is trying to find ways to secure dried cake from other sources in addition to bringing their own food waste and organics. Anaergia's Rialto facility is grant funded for pyrolysis demonstration, so they need to show proof of concept. If Encina was to give their dried cake to Anaergia, Encina would be paying Anaergia around \$50/ton.
- Anaergia's only completed installation is in Victorville. There are other installations planned in the US, but they're either in design or construction.
  - There are installations in Europe, but they're all on small digesters. BC's concern is putting Anaergia mixers on a 2 M gallon tank. However, putting the mixers on the smaller tanks may be a good fit.
- Mike states that Anaergia had previously provided them a quote on their equipment, and Anaergia was willing to give Encina a discount. Mike states that rehabbing one of the small digesters and installing an Anaergia mixer on it may be a small-scale project that can be started earlier.
- There was also a discussion on the potential consequences of starting and stopping mixers.
  - Adam states that there is potential for rapid rise to occur if you stop mixing.
  - Scott Goldman (Scott G) states that that hasn't historically been a problem at Encina.
  - Adam states that he'll reach out to Tom Chapman (Tom) to get his input on the mixing analysis.
- ACTION: Adam to reach out to Tom to get information regarding the mixing analysis.

#### **Planning for WEFTEC**

Individuals from both BC and Encina will be at WEFTEC in October. There is a plan to meet Monday afternoon to walk the floor and talk to vendors together.

• ACTION: Scott L to send a WEFTEC list to Encina and get their input.

#### Review of Mass Balance and Project Flows and Loads

BC reviewed the changes to the mass balance and projected flows and loads from the last Workshop.

- The mass balance was updated from the previous Workshop by back-calculating from historical pellets and class B cake data.
  - Scott G asks why the slope of the projections from the 2016 PMP didn't match the slope of BC's calculated projections.
  - ACTION: Hari to review the mass balance calculations and provide an explanation.
- Peaking factors for maximum 2-week and maximum week conditions were proposed based on historical data.

#### **Codigestion Planning Assumptions**

BC reviewed the codigestion planning assumptions:

- BC will prioritize the high-yield, low contamination feed stocks and leave remaining capacity for food waste.
- Under the mesophilic alternative, Encina will need to rehabilitate small digesters to allow for additional codigestion.
- In some scenarios, it's possible to demo some of the small digesters to build a receiving station.
  - o Jimmy Kearns (Jimmy) states that the old maintenance building can be demo'd.
- Adam states that the current system is limited by the organic loading rate.
  - Mesophilic digestion could take about 20,000 gpd of food waste in addition to the current delivery volumes of FOG and brewery waste, but as the loads increase, small digesters would have to be brought online.
- For thermophilic digestion, you could take 22,000 gpd forecasted out to 2030 in addition to the current delivery volumes of FOG and brewery waste. However, this is limited by the hydraulic residence time.
- However, Encina could opt for a 10-day residence day (instead of the current 15-day), and then Encina could take 92,000 gpd through 2030.
  - East Bay MUD was approved by the EPA to go down to a 10-day hydraulic residence time while operating at 120 degrees.
- Scott G states that the SWEET model should take into consideration recycle streams, ammonia, and the associated increased energy demand from the aeration process. Impacts to a future nitrification process should be considered.

#### **Screening of WAS Pretreatment Technologies**

BC reviewed the screening of WAS pretreatment technologies:

- The only technologies that passes the fatal flaw filter were CAMBI thermal hydrolysis (WAS only) and Orege SLG.
  - Tom may want to show Encina Orege at WEFTEC.

#### **Review of Biogas Train Enhancements**

BC reviewed the screening of biogas train enhancements:

- Biogas Treatment Alternatives
  - o Both gas conditioning and exhaust treatment pass the fatal flaw filter.

• They also both pass the evaluation criteria (greater than a score of 4.0), and so both alternatives will be evaluated in the SWEET model.

- Biogas Storage Alternatives
  - Dual-membrane gas holders pass the fatal flaw filter and may be a good option for the smaller tanks. Membranes are a good solution if you need gas storage and digester coverage. However, if just used as gas storage, it's not the best option because it's just a passive storage option, and it's hard to measure how much gas is in the system.
    - However, it is easier to add on older tanks because it's not as heavy as steel covers, and the dual membrane cover is compatible with Anaergia mixers.
  - The dedicated gas holder fails the fatal flaw filter because it's a new 50-foot diameter tank that Encina would need space for.

#### **Air Permitting Impacts on Project**

BC provided an update on where the air permitting process was for the project:

- Don King (Don) has submitted a BACT evaluation to the air district. The current BACT, which includes selective catalytic reduction (SCR), is not cost effective.
- Air district has responded with the question about what the "next best" threshold would be, and Don is currently preparing a response.
- Don will be submitting his final response to air permitting within the next couple of days.

#### **Conceptual Alternatives**

#### **Thickening Alternatives**

BC reviewed the thickening alternatives with Encina. The alternatives include:

- Mesophilic with the existing thickening scheme (rehab DAFTs)
- Mesophilic with RDTs
- Thermophilic with existing thickening scheme (rehab DAFTs)
- Thermophilic with RDTs
- Thermal Hydrolysis Process (THP) with RDTs

Generally, more efficient thickening provides more digestion capacity and efficiency.

#### **Stabilization and Dryer Alternatives**

BC reviewed the stabilization and dryer alternatives with Encina. The alternatives include:

- 1. Mesophilic and RDTs, with only one dryer, create Class B cake to land applications
- 2. Same as #1, but with two dryers
  - a. You wouldn't have any Class B cake going offsite.
- 3. Thermophilic and RDTs, with only one dryer, create Class B cake to land applications
- 4. Same as #3, but with two dryers
- 5. Start with #4, but move to an aggressive 10-day thermophilic option with two dryers
- 6. "Class B" THP (WAS only), Class B cake to land applications
  - a. The dryer would still be used, but anything additional would go to land application.
- 7. Class B THP, with two dryers
  - a. There's a lot of capital cost here, so probably won't be feasible.
- 8. Class A THP, with only one dryer

- a. This would create a Class A product.
- b. Most THP facilities don't have a dryer because they're confident that people would want that Class A cake.

The options with the most codigestion capacity is Option #5, then #3, #4, and then #8. RDTs would provide more hydraulic capacity, which would change the limiting factor to dryer capacity. Scott G states that the current county litigation may force all facilities to produce Class A cake.

#### **Review of Thermophilic Process and Conceptual Layout**

BC reviewed the pros and cons of the thermophilic process, and then reviewed the conceptual layout.

- Thermophilic operates at a higher temperature, within a range of 120 140 Fahrenheit.
- There is a higher organic loading rate, and the process is stable at 10-day HRT. There also wouldn't need to be a significant change in operations to implement.
- Review of the conceptual layout (Slide 38):
  - Where the heat exchangers are proposed, the gap there needs to be preserved. The gap is just big enough to let a vehicle through.
  - The location for the RDTs is okay.
  - The red box for the second dryer is currently pushing beyond the limits of the existing building. The existing wall may need to be pushed out to make room for a second dryer. The red box is pushing out over the existing DAFTs, which wouldn't be needed anymore in this alternative.
  - The green box notes the receiving area. This location isn't preferred because it's farther from the digesters and closer to the admin building.
  - The magenta box is the blend tanks. These are optional, but nice to have. The current location is problematic because it blocks the roadway in an area with high truck traffic. Another potential location to put it is south of cogeneration.
- EWA notes that the annex and old maintenance can be demolished if necessary.

#### **Review of Thermal Hydrolysis and Conceptual Layouts**

BC reviewed the pros and cons of the thermal hydrolysis process, and then reviewed the conceptual layouts:

- Thermal hydrolysis would require the addition of new equipment, including: sludge screening, centrifuge pre-dewatering, steam, and a Class A THP process.
  - ACTION: Adam to confirm the specific CAMBI model with Tom.
- The end-product would be Class A with all streams being sent through the Class A THP process.
- Review of Conceptual Layout 1 (slide 40):
  - Most of the layout is in the area where the three smaller digesters are.
  - EWA staff state that that area is very busy, and construction sequencing would be tough. This wouldn't be an ideal layout.
  - The receiving area (green box) represents an expansion of the current receiving facility. There's potential to reconfigure the existing receiving area for more capacity.
  - Adam states that the main process units that need to stay together are the pre-watering building, cake storage, and THP process. Other units, like the electrical building, could go anywhere.

 EWA staff proposed moving most of the equipment to where the old maintenance building currently is. They state that the building next to the old maintenance building, called "The Shop" is also available for repurposing. "The Shop" is a nice, high ceiling building that can repurposed for new equipment.

- Prior evaluations suggested that the THP process could be located within the existing dryer building.
- Review of Conceptual Layout 2 (slide 41):
  - Most of the equipment in this layout is moved from the three small digesters area to where the existing DAFTs are.
  - EWA staff proposes to move the receiving area (green box) to the current old maintenance building and Shop area. However, they note that there are a lot of large utilities in that area.
  - Octavio Navarrete (Octavio) asks if there's a way to put the new electrical building closer to the existing MCC. There's some space next to the MCC, where DAFT 3 currently is. If DAFTs will be demolished, there is potential to put the new electrical building there.

#### **Codigestion Alternatives**

- BC will review codigestion with all the stabilization alternatives.
- BC will also analyze the cost benefit of bringing the small digesters online.

#### **Digestion Alternatives**

BC will compare the belt filter presses and centrifuges to stabilization alternatives.

#### **Power Production Alternatives**

BC reviewed the power production alternatives and conceptual layouts:

- All the power production will be paired with a thermophilic digestion baseline for comparison.
   The best performing power production alternatives will then be combined with the best performing stabilization alternatives in the second round of analysis.
- BC will see a range of gas production, and that range will be taken into consideration in the evaluation.
- Reviewed Conceptual Layout: Engine Gas Conditioning + Exhaust Treatment (slide 47):
  - o In the upper left-hand corner (north of the small digesters), there are some agency manholes that can't be blocked.
  - EWA staff proposes to move the gas conditioning (orange box) slightly east, and replace the existing equipment there.
  - For the exhaust treatment, relocation of the existing equipment would be necessary.
- Reviewed Conceptual Layout: Microturbines with Gas Conditioning (slide 48):
  - The microturbines is a small shipping container, and it would be located wherever the gas conditioning is.
  - Adam explains that microturbines would only be used if EWA's existing permit can't be modified, and if it's not cost effective to do SCR.
- Reviewed Conceptual Layout: Digester Gas Upgrading Pipeline Injection (slide 49):
  - This alternative would require a slightly bigger footprint, and separation equipment would be added to wherever the gas conditioning equipment is.
  - EWA states that the annex area could be used for gas conditioning.

EWA informs that the current gas pipeline that feeds the facility operates at 60 – 65 psi. There is a big one on Avenida Encinas that's 100 psi.

- Reviewed Conceptual Layout: Digester Gas Upgrading Vehicle Fuel (slide 50):
  - Adam states that there's no room on-site to place a vehicle fueling station. That's why
    the conceptual layout has the vehicle fueling station south of the facility.
  - Scott M states that SANDAG is interested in building compressed natural gas (CNG) facilities in San Diego. On the bottom left corner of the figure, you can see the turnout into the transit system parking lot. That could be a convenient location for a transit fueling station.
    - Tucker Southern (Tucker) states that EWA has been approached by Volkswagon to build a fueling station because they're required to spend \$100 million.
- Reviewed Conceptual Layout: Small Scale Solar PV (slide 51):
  - The current layout proposes putting the small-scale solar PV panels over the primaries. EWA states that they don't like it over the primaries. It would be better over the aeration basins; however, EWA had already gotten a quote for that, and it wasn't cost effective.
  - o Adam states that if cogeneration is maxed out, solar would be unnecessary.
  - Mike states that member agencies will have questions regarding solar, so BC should come prepared with numbers.
- Reviewed Conceptual Layout: Large Scale Solar PV (slide 52):
  - EWA staff states that the southern parcel is 28-acre's total.
  - The current box (purple) drawn for large scale solar PV could be moved farther north to match up with the fence line.
  - EWA staff proposes the equalization (EQ) basins as potentially a good place for solar, and it would keep the algae levels down.
  - o BC and EWA discussed the possibility of virtual net metering:
    - EWA is in a position where they may produce more power than they use, which they would then export to the grid. Mike asks if there's a way to sell excess power to their member agencies, and only pay a transmission fee (not have to buy back the power from SDG&E).
    - Tucker states that SDG&E has a requirement where properties must be joined to share meters.
    - Mike states that EWA should know what the loads are from the member agencies, so they could have an "member agency demand" value.
  - ACTION: Adam to set a call between Kenny Klittich (BC) and Tucker (EWA) to discuss energy options.
- Reviewed Conceptual Layout: Dual Membrane Gas Storage (slide 53):
  - The dual gas membranes would be added atop the 3 smaller digesters.

#### **Grant Updates**

Adam provides an update on potential grants applicable to the project:

• There are no current advertisements for grant funding. There are some for batteries, but none for organics.

- BC is continuing to track the EPA's RIN quotas and determining what the values would be for codigestion.
- Mike states that EWA has elected officials that are interested in grants, and EWA should take the leadership in that arena.

#### Look Ahead and Wrap-Up

BC and EWA staff end the workshop with a look ahead:

- BC will schedule a webinar to present initial SWEET results in late October.
- Adam states that BC has developed a solids and energy baseline. However, BC still needs the current cost of operations, which will be part of the next data request.
- For Workshop 4, BC will have started some SWEET analysis, but the workshop will be focused on receiving feedback on assumptions and inputs. That feedback would then be used to finish the TM.
- During Workshop 5, BC will review the SWEET model results and present conclusions.

**Energy & Emissions Strategic Plan & Biosolids Management Plan Update** 

# Workshop #3 - September 19, 2017

**Encina Water Pollution Control Facility** 

# **Project Schedule**

- Progress on schedule
- TM 1 submitted
- Other Tasks are under way
- Workshop #3 today

# **Agenda**

- Administrative (30 min)
  - Status of data requests
  - Report out on waste hauler meeting
  - Report out on call with Anaergia
  - Review of WEFTEC schedule
- Confirm Final Mass Balance and Projected Flows and Loads (15 min)
- Presentation and Discussion on Codigestion Assumptions (20 min)
- Presentation and Screening of WAS Pretreatment Considerations (15 min)
- Review of Biogas Train Enhancements (30 min)
- Review Air Permitting Impacts on Project (30 min)
- Presentation of Conceptual Alternatives (60 min)
- Grants Update (10 min)
- Wrap-Up/Review Action Items (10 min)

# **New Data Requests**

# **Outstanding Data Requests**

- Cogen and solids systems drawings, engine cut sheets
- Engine O&M services, intervals, and costs
- Dryer system drawings and cut sheets
- Copies of current air permits (SDAPCD and Title V)
- CEPT electrical demand discrepancies

# Report Out on Waste Hauler Meeting

- Waste hauler meeting held this morning
- Goals:
  - Provide background info to haulers about EWA's goals and BEE effort
  - Determine availability of pre-processed food waste, market demand for an EWA initiative to receive more material, tipping fee range for SWEET analysis
  - Gauge interest in a renewable CNG partnership
  - Discuss "next steps" such as letter of intent, future coordination

## Report Out on Call with Anaergia from 8/29/17

- Pyrolysis project in Rialto is interested in dried cake
  - Anaergia starting to consider contracts to secure product
  - Have not determined a tipping fee. Estimate around \$50/ton range.
  - There may be an opportunity to influence a tipping rate for Encina if we get in early.
- Rialto facility will also accept dewatered cake
  - Dewatered cake target around 25% TS

# Report Out on Call with Anaergia from 8/29/17

- UTS mixing system and Omnivore
- One installation in the US (Victorville, CA)
- Other installations planned in US (in design or construction)
- Several installations in Europe (on digesters less than 200,000 gal)
- Dialogue with Anaergia is ongoing
- Food waste pre-processing:
  - Orex or Biorex for food waste preprocessing

**UTS Mixer Access Hatch** 

Omnivore recuperative thickener

## Discussion on WEFTEC Schedule

# Mass Balance and Projected Flows and Loads

## **Mass Balance**

#### MAY 2015 - JUNE 2017

# **Mass Balance Assumptions**

- The mass balance was determined using backward calculation based on historical data from pellets and class B cake. The Class B cake data were averaged with zero data to obtain an annualized daily average
- The centrifuge had an assumed percent capture rate of 95%.
- The VSR was 60% based on Van Kleeck, mass balance and engineering experience.
- WAS flows and loads were calculated based on historical data. TWAS was determined assuming percent capture rate of 95% for the DAFTs.
- FOG data were a daily average of the volumes received. This assumes FOG is fed 24/7/365. Assumes %TS and %VS are 5.5% and 80%, respectively.
- The primary sludge load was assumed to the difference of the sum of digester feed with TWAS and FOG load help constant.

# **Solids Mass Balance Comparison**

## **Solids Mass Balance Comparison (Updated)**

# **Sludge Production Peaking Factors**

	Max Month	Peak 2-Week	Peak Week	Peak Day
Primary Sludge	1.23	1.3	1.4	1.60
WAS	1.23	1.3	1.4	1.60
Combined Sludge	1.23	1.3	1.4	1.60

#### Notes:

- Peaking factors for maximum month and peak day conditions are developed based on 2016 PMP solids projections.
- Peaking factors for maximum 2-week and maximum week conditions are proposed based on historical data.

### **Power Loads and Gas Usage**

- Power:
  - Monthly production: 1,507 kW (2, 750 kW engines full output 83% of total electrical demand)
  - Monthly import: 319 kW equivalent (1,390 MWh per year)
- Digester gas:
  - Average production: 1,580,000 therms per year
  - Engines: 1,234,000 therms per year
  - Waste gas: 160,000 therms per year
  - Heat dryer: 99,000 therms per year
- Natural gas: 696,000 therms per year
  - Engines: 116,000 therms/year
  - Other plant use: 580,000 therms/year

# Codigestion Planning Assumptions (Task 4)

## Items for Discussion in Codigestion Analysis

- Will look at prioritizing high-yield, low contamination feedstocks and leaving remaining capacity for food waste
- Under mesophilic scenario, need to rehabilitate small digesters to allow additional codigestion
- Pros and cons of separate food waste digestion in small digesters
- Under other scenarios, possible to demo some of the small digesters to build a receiving station
- Analyzed scenarios up through 2030 loads

# **Initial Feedstock Analysis**

- Current system limited by organic loading rate
- Mesophilic digestion could take about 20,000 gpd of food waste but as loads increase, need to bring small digesters on line.
- 15-day thermophilic digestion could take 22,000 gpd of food waste but is limited by hydraulic residence time
- Can opt to move towards 10-day thermophilic operation (EBMUD), which allows up to 92,000 gpd through 2030

# Screening of WAS Pretreatment Technologies (Task 4)

### **Fatal Flaw Filter**

- Applied uniformly across all technologies
- Four criteria:
  - At least one successful North American installation of technology
  - At least one successful installation in a facility of similar size
  - Available space
  - Compatibility with plant size and any existing equipment

# **WAS Pre-Treatment Technologies Analyzed**

- Sonolyzer: Sonication cell lysis
- BioCrack: Electrokinetic cell disintegration
- Lysotherm: Temperature and pressure hydrolysis using thermal oil
- Crown Disintegration: Pressure release disintegration
- OpenCEL: Electric focused pulse disruption. Bankrupted
- Microsludge: High pressure cell disruption. Bankrupted
- WAS Only Cambi\*: Thermal hydrolysis WAS only
- Orege SLG Solution: compressed air addition upstream of digestion

## WAS Pre-Treatment Technologies – Fatal Flaw

	Technology Maturity	Successful Operation of Comparable Size	Available Space	Compatibility
Sonolyzer	Fail	Fail	Pass	Pass
BioCrack	Fail	Fail	Pass	Pass
Lysotherm	Fail	Fail	Pass	Pass
Crown Disintegration	Fail	Fail	Pass	Pass
OpenCEL	Fail	Fail	Pass	Pass
Microsludge	Fail	Fail	Pass	Pass
Cambi Thermal Hydrolysis – WAS only	Pass	Pass	Pass	Pass
Orege SLG	TBD	TBD	Pass	Pass
Orege SLG TBD TBD Pass Pass				

# Review of Biogas Train Enhancements (Task 4)

## **Biogas Treatment Alternatives**

	Technology Maturity	Successful Operation	Available Space	Compatibility	
Gas Conditioning	Pass	Pass	Pass	Pass	
Exhaust Treatment	Pass	Pass	Pass	Pass	

# **Biogas Treatment Alternatives**

	Gas Conditioning	Gas Conditioning +Exhaust Treatment	
Proven Technology Performance	5	4	
Minimize Life Cycle Costs	3	4	
Energy/Resource Recovery	4	5	
O&M Impacts	4	3	
Environmental Impacts	3	4	
Community & Stakeholder Impacts	4	5	
Project Site Compatibility	5	4	
Weighted Score	4.05	4.25	

# **Biogas Storage Alternatives**

	Technology Maturity	Successful Operation	Available Space	Compatibility
Dystor type double membrane gas holder	Pass	Pass	Pass	Fail
Dedicated gas holder	Pass	Pass	Fail	Pass

# Air Permitting Impacts on Project

## EWA is actively pursuing air permit modification

- EWA (with Don King) submitted a request for permit modification
- Current BACT (requiring SCR) not cost effective
- The air district responded with question about "next best" threshold – EWA (with Don King) preparing a response
- Goal is to adjust the CO emission rate from 530 ppm to ~400 ppm, and thereby adjust the fuel input limit aimed at keeping CO emissions below Title V synthetic minor threshold
- If successful, this effort would increase permitted cogen capacity by ~20%
- This increase would allow EWA to meet plant electricity demand with current digester gas flows and cogen system

# **Conceptual Alternatives**

## **Evaluating Technologies and Markets Together**

# **Thickening Alternatives**

- Mesophilic and existing thickening scheme (rehab)
- Mesophilic and RDTs
- Thermophilic and existing thickening scheme (rehab)
- Thermophilic and RDTs
- Cambi and RDTs

Generally, more efficient thickening provides more digestion capacity and efficiency

# Stabilization and Dryer Alternatives

- 1. Mesophilic and RDTs, one dryer, Class B cake to land app
- 2. Same as #1 but with 2 dryers
- Thermophilic and RDTs, one dryer, Class B cake to land app
- 4. Same as #3 but with 2 dryers
- 5. Maximize codigestion Aggressive (10-day) Thermophilic, two dryers
- 6. "Class B" Cambi, WAS only, Class B cake to land app
- 7. Class B Cambi with two dryers
- 8. Class A Cambi, only one dryer

# Mesophilic

#### **Features**

- Operates at 95-100 °F
- Requires 15-day HRT/SRT to comply with Process to Significantly Reduce Pathogen (PSRP, EPA part 503)
- Organic loading typically limited to 0.18 lbs. VS/cf-day
- Produces Class B biosolids

#### **Pros and Cons**

- Pros:
  - Simple to operate
  - Lower energy demand than other processes
  - No additional footprint needed
- · Cons:
  - Limited capacity to accept high strength waste; would need to rehab small digesters to accommodate other feedstocks
  - Current end use markets limited to regional compost or bulk agriculture in Arizona

# Thermophilic

#### **Features**

- Operation at ~135°F
- Can be stable at 10-day HRT based on organic loading limitation of 0.35 lbs.
   VS/cf-day
- Minor improvement in process VSR and gas production
- In proposed configurations, generates
   Class B biosolids

#### **Pros and Cons**

- Pros:
  - Comparable operation to mesophilic; no significant operational change necessary
  - Higher allowable OLR provides capacity for acceptance of high strength wastes
- Cons:
  - Current end use markets limited to regional compost or bulk agriculture in Arizona

# **Thermal Hydrolysis**

#### **Features**

- Requires addition of new equipment:
- Addition of Sludge Screening
- Addition of Centrifuge Pre-Dewatering
- THP Will assume Cambi B6-4(s)
- Requires steam
- Produces Class A with all streams sent through Cambi

#### **Pros and Cons**

- Pros
  - Improved digestion and dewaterability allows for greater digester and dryer capacity; prolonging available dryer capacity
  - Allows for addition of high strength wastes into process train
  - Generates a high quality Class A cake, suitable for more local reuse
- Cons
  - More operational complexity
  - Occupies a greater footprint than digestion-only options
  - Somewhat greater energy demand

### **Building Dimensions – Biosolids Alternatives**

- For THP Layout:
  - Pre-THP Dewatering Building: 60' x 90'
  - Odor Control Building: 60' x 30'
  - Thermal Hydrolysis Process (THP): 50' x 90'
    Cooling UEV: 6'
  - Prepared by Brown and Caldwell Cooling HEX: 8' x 22' each

# Thermophilic - Conceptual Layout

# Thermophilic – Andritz Dryer

# THP - Conceptual Layout 1

# THP - Conceptual Layout 2

# **Codigestion Alternatives**

- Codigestion with all stabilization alternatives
- Possibility to include separate food waste digestion in little tanks (for discussion) Prepared by Brown and Caldwell

# **Dewatering Alternatives**

 Belt filter presses and centrifuges to be compared for performance with stabilization alternatives

### **Power Production Alternatives**

- Will be paired with a thermophilic digestion baseline for comparison
- Best performing power production alternatives will be prepared by Brown and Caldwell combined with best performing stabilization alternatives in second round of analysis

### **Alternatives: Power Production**

- Baseline: Existing cogen + drying
- Baseline + gas conditioning
  - Gas conditioning serves to reduce O&M costs associated with engines and dryer
- Existing cogen + vehicle fuel (via pipeline injection or tube trailer)
  - No permit modification to cogen / no DG to dryer
  - Continue to operate two engines
  - Additional gas routed to vehicle fuel
- Existing cogen + microturbines
  - Includes gas conditioning
  - No permit modification to cogen / no DG to dryer
- Existing cogen + steam boiler/turbine
  - No permit modification to cogen / no DG to dryer
  - Additional gas routed to steam boiler; steam used in small turbine
- New cogen permit, CO catalyst and SCR, gas conditioning
  - Need to consider plant demand as a limit on power production
- Vehicle Fuel (primary use of DG) + existing cogen (natural gas + tail gas)

"All in" on vehicle fuel

# **Building Dimensions – Power Alternatives**

- Gas Conditioning: 25' x 80' (+ chiller)
- Exhaust Treatment: 20' x 75'
- Digester Gas Upgrading:
  - Pipeline injection: 50'x 95'
  - On-site vehicle fueling: additional 120' x 150' (fast fill)
  - Replaced the old Maintenance Building
- Microturbines: depends on desired capacity

# **Engine – Gas Conditioning + Exhaust Treatment**

# Microturbines with Gas Conditioning

# **Digester Gas Upgrading - Pipeline Injection**

# Digester Gas Upgrading - Vehicle Fuel

#### Notes:

- 400 scfm fast fill station with 48 hours of CNG storage, medium pressure storage, single stage separation membranes and 4 fuel dispensers.
- Footprint can be smaller with slow fill station, less storage, and fewer dispensers

## **Small Scale Solar PV**

## Large Scale Solar PV

## **Dual Membrane Gas Storage**

## **Grant Updates**

## **Grant Updates**

- No current advertisements for grant funding
- Tracking EPA movements on RIN quotas and determination on codigestion (D3 or D5 RINs) Prepared by Brown and Caldwell
- Potential for local air district grant?

## **Self Generation Incentive Program**

Program	Self-Generation Incentive Program (SGIP)	
Agency	California Energy Commission / administered by SDG&E	
Eligible Projects	Self-generation projects such as new engines, microturbines, or steam turbines – increased incentives for renewable/biogas projects; Energy storage / batteries	
Funding	Incentives based on anticipated power output – based on fuel availability, not nameplate capacity; 50% paid upfront / 50% paid over 5 years based on performance	
Schedule	Funding available each year / first-come, first-served Battery funding decreases as tiers fill up Projects must be operational within 18 months of award	
How much are we talking?	~\$500k - \$1M depending on project size	
Recommendation for SWEET Analysis	Don't count on funding to justify project economics	
Next steps	Continue to track / pursue if selected alternatives meet criteria	

### **Low-Carbon Fuel Standard**

Program	Low-Carbon Fuel Standard (LCFS)	
Agency	California Air Resources Board	
Eligible Projects	Part of AB 32 scoping plan – projects that reduce the carbon intensity of California's vehicle fuel – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, recently extended through 2030	
How much are we talking?	Varies could equate to $\sim 0.50/DGE - 1.00/DGE$ depending on market factors	
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2030, use conservative values	
Next steps	Continue to track / pursue if vehicle fuel is recommended	

### Renewable Fuel Standard

Program	Renewable Fuel Standard	
Agency	US Environmental Protection Agency	
Eligible Projects	Renewable fuel projects – i.e. renewable compressed natural gas (CNG vehicle fuel)	
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs	
Schedule	Ongoing program, not guaranteed beyond 2022	
How much are we talking?	A lot of uncertainty: Wastewater digester gas is eligible for highest value of RINs – D3 EPA has recently stated that DG from food waste is a lower value – D5 EPA has the ability to set RIN quotas, which drive supply-and-demand, market-based pricing	
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2022, use conservative values	
Next steps	Continue to track / pursue if vehicle fuel is recommended	

## **Organics Grant Program**

Program	Organics Grant Program
Agency	Department of Resource Recovery and Recycling (CalRecycle)
Eligible Projects	Projects that serve to divert organics (food waste) from landfill – toward anaerobic digestion or composting; recently issued with a food rescue requirement
Funding	Incentives based on project size and potential tons diverted
Schedule	Recently awarded, not expected to reissue for ~18 months
How much are we talking?	Up to \$4M per project
Recommendation for SWEET Analysis	Do not include – too competitive to count on
Next steps	Continue to track / pursue if food waste receiving is recommended

## **Heathy Soils Program**

Program	Healthy Soils Program
Agency	California Department of Food and Agriculture
Eligible Projects	Demonstration projects that sequester carbon and reduce GHG emissions – groups within CASA
Funding	Incentives based on project size and potential GHG benefit
Schedule	Currently accepting applications through September 19 Annual funding program (AB 32 funds), amounts and criteria may vary
How much are we talking?	Up to \$3.75M total
Recommendation for SWEET Analysis	Do not include / ancillary benefit to support end use program
Next steps	Continue to track / connect with CASA Science and Research Group for potential partnerships

## **Green Project Reserve**

Program	Green Project Reserve
Agency	California Water Resources Control Board
Eligible Projects	Projects that improve energy efficiency, renewable energy generation, or recycled water production
Funding	A component of Clean Water State Revolving Funding; Green Project Reserve is a "loan forgiveness" program CWSRF is generally oversubscribed, but GPR is underutilized
Schedule	Ongoing
How much are we talking?	Up to \$4M per project, or 50% of project value, whichever is higher
Recommendation for SWEET Analysis	Do not include
Next steps	Something for EWA to keep in mind – if a larger capital project requires funding, consider CWSRF and adding an eligible GPR component

## Look Ahead & Wrap-Up

## **Project Schedule**

- Schedule webinar for initial SWEET results in late October
- TM 1 delivered today
- TMs 2 and 3 delivered by month end
- Next in-person workshop in December

## **Look Ahead – December Workshop**

- Results of initial SWEET analysis
- SWEET sensitivity analysis
- Screening and creation of new alternatives for Round 2 SWEET analysis
- Initial Development of Non-Cost Criteria
- Grants update

## Wrap-Up

## QUESTIONS?

essential ingredients®

## **Bull Pen**

## **Digestion Processes**

Mesophilic

Thermophilic

Class-A Thermophilic

Thermal Hydrolysis

- Operates at 95-100 °F
- Requires 15-day HRT/SRT at Max14 Loading to comply with Process to Significantly Reduce Pathogen (PSRP, EPA part 503)
- Organic loading limited to 0.18 lbs. VS/CF-Day at Max14 with one out of service

## **Thermophilic**

- Operation at ~135°F
- 7-Day SRT/HRT at Max07 with one unit out-of-service
- Likely limited to 9- or 10-Day based on organic loading limitation of 0.35 lbs. VS/CF-Day at Max07
- No improvement in process VSR and gas production
- Not Class-A by itself; But can be modified for Class-A

## Thermal Hydrolysis

### Assumes:

- Addition of Sludge Screening
- Addition of Centrifuge Pre-Dewatering
- THP Will assume Cambi B6-4(s)

## Baseline includes cogeneration (permit limited), dryer and some flaring

### **Baseline**

### Gas conditioning could reduce engine and dryer O&M costs associated with siloxanes

### **Baseline with Gas Conditioning**

## With the existing permit in place, where else can we send digester gas to get highest value?

### **Existing Cogen Options - No Permit Modification**

# A permit modification allows EWA to meet plant electricity demand, but any additional gas would need to go to a non-generating use

## An all-vehicle-fuel option may deliver the best economics

### **Vehicle Fuel**

#### 1. INTRODUCTION

The co-digestion of biodegradable wastes with municipal sludge at wastewater facilities employing anaerobic digestion has been receiving more and more attention over the past several years. Some key drivers for this are:

- Produce additional biogas that can be used to generate electricity or offset natural gas needs
- Divert biodegradable wastes from other disposal paths (e.g., landfills)
- Utilization of existing anaerobic digestion capacity at wastewater facilities

In 2011, the Encina Wastewater Authority (EWA) decided to implement co-digestion of Alternative Fuels (AFs) through its energy and emissions strategic planning effort. EWA started operation of its Alternative Fuel Receiving Facility (AFRF) at the Encina Water Pollution Control Facility (EWPCF) in 2015.

#### 1.1 Objectives of this Technical Memorandum

The EWA engaged Trussell Technologies, Inc. (TT) to provide technical support for the anaerobic digestion process at the EWPCF, focusing on an evaluation of the AF system. This technical memorandum (TM) presents the findings of the evaluation according to the objectives listed below:

- a) Summarize EWA's experience with AF co-digestion to date
- b) Provide an overview of relevant co-digestion programs in California
- c) Summarize the key findings from a literature review on co-digestion of AFs
- d) Describe process considerations for AF co-digestion at EWPCF, including capacities of the AF and related systems
- e) Present operational strategy and process monitoring recommendations

#### 1.2 Alternative Fuel Co-Digestion Experience at EWPCF

Except for some short-term testing on brewery waste in April 2017, all the AF co-digested so far at EWPCF has been Fats, Oil, and Grease (FOG) from Liquid Environmental Solutions of California, LLC (LES) through a competitively let contract awarded in December 2013. FOG co-digestion has been conducted continuously since May 2015, with deliveries from LES of 80,000 gallons per week (the maximum contracted volume) since January 2017. A comparison performed by RMC of digester gas production in 2016 with FOG co-digestion to digester gas production in 2014 before FOG co-digestion showed a volumetric increase of 29% with similar methane content, which corresponds to a unit energy production factor of approximately 0.104 therms per gallon of LES FOG. It should be noted that, in addition to biomethane being produced directly from the AF, enhanced digestion of the municipal sludge due to co-digestion can contribute to the increase in biomethane production.

EWA performed side-by-side co-digestion testing of LES FOG and a brewery waste from Stone Brewery known as Dewatered Lauter Tun Drip (LT Drip) in April 2017. For the testing, FOG was fed to Digester 5 and Dewatered LT Drip was fed to Digester 6 to assess the relative performance of the two AFs as the two digesters were fed typical volumes of municipal sludge equally. The limited data on the composition of the AFs are presented in Table 1.

**Table 1 Alternative Fuel Composition** 

Parameter	Units	Alternative Fuel (AF)	
		LES FOG	Dewatered LT Drip
Total Solids (TS)	%	1-10	4-6
COD(total)	mg/L	100,000-200,000	60,000-130,000
Volatile Solids (VS)	% of TS	-	~98

No problems related to digester stability were observed during the month-long test in which a total of 409,812 gallons of FOG and 290,365 gallons of Dewatered LT Drip were fed to Digester 5 and Digester 6, respectively. Dividing the digester gas produced from each digester by the volume of AF fed over the test period indicated the co-digestion of Dewatered LT Drip resulted in about 38% more digester gas production than co-digestion of LES FOG per gallon of AF. Lab analysis of Dewatered LT Drip performed after this testing indicated that nearly all the COD was in the soluble form, which allows this AF to biodegrade easily.

## 2. OVERVIEW OF CO-DIGESTION PROGRAMS AT WASTEWATER FACILITIES

An overview of three significant co-digestion programs implemented at California wastewater facilities is provided below. The AFs used in these programs include FOG, food waste (FW) slurry, food scraps, poultry processing waste (blood and body parts), cheese and yogurt production waste. Our review did not identify a program where brewery waste is being co-digested with municipal sludge at full scale.

#### 2.1 FOG at San Francisco Public Utilities Commission (SFPUC)

The SFPUC began FOG co-digestion in 2010 at its Oceanside Plant, a 21 MGD (currently treating 15 MGD) pure oxygen activated sludge plant designed for BOD removal. It has four egg-shaped digesters (0.75 MG each) operated in a single-stage mesophilic mode. The FOG receiving and injection equipment includes six tanks (4,000 gallons each), and a mixing and heating system capable of heating the FOG to 150 degrees F. Over a study period of January to August 2012, the FOG averaged total solids (TS) of 6%, volatile solids (VS) of 93%, pH of 4.2, and chemical oxygen demand (COD) of approximately 144,000 mg/L. The VS from FOG fed to the digesters averaged 6% of the total VS fed, and for short periods this value reached as high as 47% with no negative impacts on the digestion process. FOG co-digestion increased the volume of biogas produced by 19%, and the methane content of the biogas from 59% to 63%. This corresponded to an increase in methane gas production of 27%.

Other impacts of FOG co-digestion on the performance of the Oceanside Plant's digestion system are summarized below.

- The seasonal foaming typically experienced during warmer months (June to October) was not observed to be different (i.e., was not made worse or improved).
- No significant difference was observed in the mass of digested sludge to be disposed of.
- No scum layer formation or grease flotation was observed in the egg-shaped digesters despite the gradual decrease in digester mixing from six turnovers per day to less than three.

### 2.2 Food Waste Slurry at Los Angeles County Sanitation Districts

The Los Angeles County Sanitation Districts (LACSD) started a demonstration program to co-digest FW slurry in one of its 24 active digesters (3.7 MG each) at the Carson facility in 2014. A single-stage mesophilic digestion process is utilized. They contracted with Waste Management to provide a FW slurry known as Engineered BioSlurry (EBS), which is source separated food wastes from grocery stores, food processors, and restaurants that are processed into a slurry of about 14% TS. The FW slurry, similar in thickness to cooked oatmeal, has a VS of approximately 92%, and COD of 222,400 mg/L. The food waste slurry specifications include the criteria listed below.

1. pH:	3.0 – 7.0
2. Total Solids:	10.0 – 15.0%
3. Volatile Solids (% of Total Solids):	Greater than 80%
4. Electrical Conductivity:	Less than 15 millimho/cm
5. Volatile Acids (Acetic Acid Equivalents):	Less than 15,000 mg/L
6. Total COD:	Greater than 160,000 mg/L
7. Total BOD:	Greater than 80,000 mg/L
8. Specific Gravity@25°C:	0.95 - 1.10
9. Kinematic Viscosity@25°C:	Less than 200 cps
10. Ammonia as Nitrogen (NH <sub>3</sub> -N):	Less than 600 mg/L
11. Total Kjeldahl Nitrogen (TKN):	Less than 7,500 mg/L
12. Total Carbon:	Greater than 9,000 mg/L
13. Arsenic:	Less than 1 mg/L
14. Calcium:	Less than 3,000 mg/L
15. Chloride:	Less than 3,000 mg/L
16. Chromium:	Less than 2 mg/L
17. Magnesium:	Less than 500 mg/L
18. Mercury:	Less than 1 mg/L
19. Nickel	Less than 5 mg/L
20. Potassium:	Less than 3,000 mg/L
21. Sodium:	Less than 3,000 mg/L
22. Total Heavy Metals( Ag, As, Ba, Cd, Co, Cr, Cu,	
Hg, Mo, Ni, Pb, Sb, Se, Ti Sr, Sn, V, and Zn):	Less than 50 mg/L
23. Film Plastic > 4 mm	Less than TBD % by dry weight
24. Glass > 4 mm	Less than TBD % by dry weight

LACSD's FW slurry co-digestion plan is summarized in Table 2.

25. Total Inerts > 4 mm (Film and hard plastics, Glass, metal & rocks) (Method TMECC 0306)

Less than TBD % by dry weight

**Parameter** Units **Test Digester Control Digesters** Wastewater 205,000 205,000 gal/day **Sludge Feed** % solids 3.2% 3.2% 27.3 27.3 tons per day solids **Food Waste** gal/day 20.000 **Slurry Feed** % solids 14% --tons per day solids 11.7 % Food Waste 9% volume basis ---Slurry solids basis 30% **Total Feed** gal/day 225,000 205,000

**Table 2 Food Waste Slurry Co-Digestion Plan at LACSD** 

The feed rate target of 20,000 gal/day for FW slurry was reached in October 2016, and the biogas production in the test digester has been about 62% greater than the control digesters. The test digester has demonstrated a higher volatile solids reduction (VSR) (54.4% versus 50.3% for the control), which translates to similar TS and VS in the digested sludge for the test and control digesters (test digester: 2.37% TS and 60.9% VS; control digester: 2.28% TS and 59.5% VS). LACSD reports that treatment plant operations are not significantly impacted by the co-digestion, and the success of this program has led to plans to expand the FW slurry co-digestion to four additional digesters (i.e., 100,000 gal/day). A couple of challenges to be aware of are controlling the amount of inert material in the food waste slurry (e.g., grit and plastics), and its relatively high viscosity can lead to long truck unloading times.

#### 2.3 High-Strength Waste at East Bay Municipal Utility District (EBMUD)

% solids

HRT, days

Motivated in part by excess capacity in both the liquid and solids treatment processes (i.e., design capacity of 120 MGD and currently treats 50 MGD), EBMUD began co-digesting organic wastes with their municipal sludge more than a decade ago. Along the way, they've performed many studies and tests to improve the understanding of the mechanisms and impacts of co-digestion. Currently, the eleven digesters are operated in a two-stage, thermophilic configuration where the first stage is maintained at 50 degrees C (122 deg F), and the second stage is not heated. A summary of EBMUD's co-digestion program is given below.

- FOG is received at a rate of 50,000 60,000 gal/day
- Food scraps are received at 10 15 tons/day
- Protein wastes (e.g., blood, chicken parts, cheese waste, and yogurt waste) are also received
- All co-digestion waste is received in blend tanks (two at 200,000 gal each) where it is processed into a pulp for injection into first stage digesters
- Online COD analyzers are utilized to control loading rates
- The average HRT is about 15 days (facility is approved for a 10-day running average HRT)
- Energy from biogas met about 50% of facility demand prior to co-digestion
- Energy from biogas currently meets 130% of facility demand (i.e., export to grid)

Challenges have been experienced with the grit content of the FOG, inert debris in the food scraps (e.g., plastics), and digester foaming when lactose was co-digested. EBMUD has reported the following findings related to the co-digestion of food scraps.

- a) Food scraps produce as much or more energy than wastewater solids per ton of dry solids fed to the digesters.
- b) VSR of food scraps proceeds at a quicker rate and to a greater extent than wastewater solids (VSR is 70% 80% for food scraps, and 50% 60% for wastewater solids).
- c) Food scraps produce about half the dry tons of digested sludge compared to wastewater solids.

#### 3. LITERATURE REVIEW

A literature review was conducted to identify items that could be relevant to the decisions EWA will be making on co-digestion of AFs. As such, this review focused on the co-digestion of FOG, FW slurry, and brewery wastes with wastewater solids since these AFs are the most likely to be utilized by EWA. The key areas of interest were the loading rates used, DG production, digester stability impacts, solids dewatering impacts, and impacts on the quality of return streams (e.g., centrate).

### 3.1 FOG Co-Digestion

Articles relating to FOG co-digestion have a common theme that a significant increase in DG production can be realized with little risk of negative impacts. Suto et al. (2006) conducted bench scale tests of FOG co-digestion with primary and secondary sludge from the main EBMUD plant at mesophilic (95 deg F) and thermophilic (122 deg F) temperatures. Their observations are summarized below.

- FOG characteristics (TS, VS, COD) were highly variable.
- FOG feed rates of 20% and 35% of total feed (by volume) resulted in increases in DG production of 17% to 94% while maintaining stable digester conditions.
- A FOG feed rate of 50% of total (by volume) resulted in digester instability after about 10 days.
- Thermophilic digestion showed an increased ability to degrade the long chain fatty acids (LCFAs) associated with FOG compared to mesophilic digestion.

A key component of FOG for methane production are the LCFAs, which are composed of a carbon chain  $(C_8 \text{ to } C_{20})$  with a carboxyl group on the end. Many researchers have observed inhibition of methane production due to LCFAs, with the mechanism thought to be LCFAs adsorbing to bacterial cell membranes, resulting in mass transfer limitations. Consequently, the upper limit for FOG loading to maintain stable digestion may be a function of LCFA concentrations. Suto et al. (2006) observed that oleic acid  $(C_{18})$  and palmitic acid  $(C_{16})$  were the most abundant LCFAs in the FOG used in their study. Addition of these specific LCFAs showed inhibitory effects when the concentrations in the mesophilic digester sludge reached 1,600 mg/L for oleic acid, and 4,000 mg/L for palmitic acid.

Kabouris et al. (2009) performed bench scale tests of FOG co-digestion with primary and secondary sludge from a plant in Pinellas County Florida at mesophilic (95 deg F) and thermophilic (126 deg F) temperatures. They observed stable digestion when FOG accounted for 48% of the VS loading, and the methane yield per unit mass of VS added at mesophilic temperature was 2.9 times greater than digestion without FOG addition (290% of the normal methane production). Pinellas County used a FOG that had been dewatered using gravity separation with polymer addition.

Other investigators (Li et al., 2013; Tandukar and Pavlostathis, 2015) have observed similar results (i.e., stable digestion at high FOG loading rates with significant increases in DG production). Due to the very high volatile solids reduction (VSR) for FOG (typically over 90%) and increased VSR for the wastewater

solids that often accompanies FOG co-digestion, the dry weight of solids to be dewatered is usually the same or less than digestion without FOG addition.

# 3.2 Food Waste Slurry Co-Digestion

The LACSD FW slurry program described earlier provides the most relevant guidance to potential FW slurry co-digestion at EWA, with the key items being the loading (30% of solids loading from FW slurry) and the criteria relating to the composition of the FW slurry. A review of the literature revealed that potential inhibition of methane production at higher loadings is likely caused by volatile fatty acid (VFA) accumulation resulting from the acidogenesis stage of digestion, which causes a drop in pH that inhibits methanogenesis (Hobbs et al., 2017). (note: volatile acid (VA) and VFA are often used interchangeably)

Cabbai et al. (2016) conducted a pilot scale study of the mesophilic co-digestion of FW slurry (derived from fruit and vegetable waste) with municipal sludge from a wastewater plant in Udine, Italy. The pilot digester (1:1000 scale of full size digester at the Udine facility) was initially operated without FW at a municipal sludge loading rate similar to the full scale (0.05 lb VS/ft³-day), followed by a series of phases in which the FW slurry was increased from 1.5% to 29% of the total feed (volume basis). The highest VS loading rate tested was 0.2 lb VS/ft³-day, with stable digester operation observed for all feed rates. The authors suggested the digester biology can tolerate higher organic loadings than the maximum value tested since their stability parameter (ratio of intermediate alkalinity from volatile organic acids to alkalinity from bicarbonates) never exceeded 0.10, well below 0.4 which is considered the upper limit for stable digester operation. The VSR increased as the FW slurry loading increased, with a VSR of 33% with no FW to 67% at the highest loading. As a result of the increased VSR, the TS in the digested sludge remained relatively constant at all loading rates. The methane content of the DG without FW slurry was 63%, and this value ranged between 64% and 71% during food waste co-digestion. The maximum DG production rate, observed at the highest loading rate, was 2.9 times greater than with no FW.

Our literature review re-emphasized the point that the nitrogen content (e.g., ammonia and protein content) of the FW slurry is an important consideration since nitrogen rich substrates can lead to high ammonia concentrations in the digesters. Inhibition of methane production can occur when ammonia reaches 1500 mg/L. Unlike FOG, which has a low nitrogen content, the nitrogen content of FW can vary greatly. The potential for ammonia toxicity is why LACSD has included ammonia and TKN (Total Kjeldahl Nitrogen) limits in their specifications for FW slurry.

### 3.3 Brewery Waste Co-Digestion

The beer brewing process produces multiple wastes, which includes spent grain, spent yeast, and the liquids from the processing and handling of the grain and yeast. Compared to FOG and FW co-digestion with wastewater solids, there has been much less published on the topic of brewery waste co-digestion. This is due to:

- Brewery waste being much less widespread than FOG and FW;
- Brewery waste has value as animal feed, and even as a component of food for human consumption;
- Breweries implementing their own waste-to-energy projects.

Nansubuga et al. (2015) studied the co-digestion of brewery waste with primary sludge from a wastewater plant in Kampala, Uganda. No details were given on whether the brewery waste was from a particular process at the brewery (e.g., spent yeast). The bench scale co-digestion was performed at mesophilic temperature at a retention time of 20 days. The brewery waste had a TS of 6.2%, VS of 77%, pH of 4.4, COD of 150,000 mg/L, and ammonia nitrogen of 67 mg/L. The primary sludge showed relatively poor biodegradability (VS around 50%) by itself due to long travel times in the sewers. The investigators

observed stable digester operation at a brewery waste feed rate of 50% of total (by volume), with a DG production rate three (3) times greater than with no brewery waste. A test receiving only brewery waste as feed became unstable (pH drop) at a retention time of 28 days.

Earlier studies (Pecharaply et al., 2007; Barbel et al., 2009) tested the co-digestion of brewery sludge with wastewater solids from a Bangkok, Thailand wastewater plant. Since the main objective of the studies was to assess the impact of co-digestion on the suitability of the dewatered sludge as a fertilizer for agriculture (e.g., pathogen, heavy metal, and nutrient content), the amount of data presented on the co-digestion process was limited. Their bench scale tests at mesophilic temperature did indicate that a brewery waste feed rate of 75% of total (by weight), which corresponded to a VS loading rate of 0.094 lb VS/ft³-day, provided the highest DG production and VSR (note: this is a relatively low loading rate in terms of typical anaerobic digesters). The reported DG methane content for all brewery waste feed rates tested was surprisingly high at over 70%.

### 4.0 PROCESS CONSIDERATIONS FOR EWPCF

For the co-digestion of AFs at EWPCF, process considerations relating to digester stability, digester gas use and production, solids dewatering and drying, and centrate quality are discussed in this section.

### 4.1 Digester Stability

The stability of the AD process can be affected in various ways when AFs are being co-digested and are summarized below:

- a) LCFA inhibition of methanogenesis due to high LCFA concentrations from FOG addition

  The inhibition of methanogenesis means the conversion of VFAs slows down, which in turn leads to an increase in VFA concentration and an associated drop in pH. Since the literature has mixed results as to whether higher FOG loadings translate to LCFA inhibition, the risk of this type of inhibition is expected to be relatively low.
- b) Digester acidification (pH drop) due to excessive loading (Volatile Solids or Organic) Under conditions of digester overloading, the formation of VFA (acidogenesis) exceeds the rate of VFA utilization by methanogens, which leads to VFA accumulation. All of the AFs considered in this memo (i.e., FOG, FW slurry, and brewery waste) have the potential for this type of impact.
- c) Ammonia inhibition due to the toxic effect of ammonia at high concentrations

  The AD of organic nitrogen (e.g., protein) produces ammonia, which is toxic in its nonionized form (NH<sub>3</sub>) (Rittmann and McCarty, 2001). An ammonia nitrogen concentration of about 1500 mg/L is typically cited as the concentration where inhibition of methanogens begins. FW slurry and brewery waste containing significant organic nitrogen can lead to ammonia inhibition.
- d) Hydrogen sulfide inhibition due to toxicity at high concentrations
  The AD of sulfate and organic sulfur compounds produces hydrogen sulfide, which can be toxic to the digester biology at concentrations above 200 mg/L. FOG is typically low in sulfur, but food waste slurry and brewery waste may contain enough sulfur to be of concern.
- e) Heavy metal inhibition due to toxicity at high concentrations Since the AFs under consideration are typically low in heavy metals, the risk of this type of inhibition is expected to be relatively low.
- f) Potential to exacerbate digester foaming Lactose addition has been reported to have a high risk of digester foaming and/or acidification. Consequently, this AF should be avoided.

The monitoring of typical parameters associated with digester operation like the VFA to alkalinity ratio (VFA/Alk), ammonia concentration, hydrogen sulfide concentration, and heavy metal concentrations will

greatly reduce the risk of digester instability. Specifying and monitoring criteria for the content of AFs received will reduce the risk further. In addition, digester stability has been shown to be more robust at thermophilic temperature (Kabouris et al., 2009; Sprague et al., 2012), especially when it comes to VS/organic loading. This isn't surprising because of the fundamental impact of temperature on the rate of biochemical transformations (i.e., an increase in temperature of 10 degrees C typically results in a doubling of reaction rates). Implementation of thermophilic digestion is an option for increasing the VS loading capacity without increasing digester volume.

# **4.2 Digester Gas Use and Production**

Since increasing DG production for beneficial use is an important motivation for implementing AF codigestion, we need to understand just how much DG can be utilized. A schematic representation of the AF System at the EWPCF is shown in Figure 1.

Figure 1 Schematic of AF System Showing Various Capacities and Operating Conditions

As shown in Figure 1, digester gas can be beneficially used by Co-gen and the Heat Dryer. By design, this equipment utilizes both natural gas (NG) and DG. A summary of DG and NG use, along with DG production, is presented in Table 3.

Table 3 Summary of DG and NG Use Along with DG Production

		Therms/week	Therms/day	Notes/Comments
<u>Heat</u>	<u>Dryer</u>			Based on May 2016 - April 2017 data
	Total gas use	11,800	1,686	Heat Dryer typically runs at or near capacity
	Current NG use	9,660	1,380	About 80% of capacity based on therms
	Current DG use	2,140	306	About 20% of capacity based on therms
	Max DG use	9,440	1,349	Design capacity is 80% of therm load
	Min NG use	2,360	337	20% of therm load from design
	Additional DG use	7,300	1,043	Additional DG that can be used by Heat Dryer
Co-ge	n Engines			Based on May 2016 - April 2017 data
	Current DG use	23,600	3,371	, ,
	Current NG use	2,245	321	
	Additional DG use	4,700	671	20% increase in DG to co-gen upon permit modification

	Production from Food			through testing. Composition of EBS (i.e., lipid,
1	Waste Slurry			carbohydrate, and protein content) should be
		<u> </u>		evaluated prior to testing.
* Tho	additional DC production		n additional 90 0	20 gal Awark of EOC and 25 000 gal/work of

<sup>\*</sup> The additional DG production estimated from an additional 80,000 gal /week of FOG and 25,000 gal/week of LT Drip (green cells; 11,940 therms/week) is about the same as the added DG demand from the Heat Dryer and Co-gen Engines (orange cells; 12,000 therms/week). An additional 12,000 therms/ week will increase the current DG production of approximately 4,500 therms/day to 6,200 therms/ day, which is approaching but still below the Flare's design capacity of 6,480 therms/day.

As noted in Table 3, the Heat Dryer and Co-gen Engines can use an additional 12,000 therms/week of DG to reach their maximum DG use (based on design and permit limits). This added DG demand can be met by co-digesting an additional 80,000 gal/week of FOG and 25,000 gal/week of Dewatered LT Drip. For completeness, Table 3 includes guidance on how DG production from FOG received from another source, spent yeast from a brewery, and FW slurry can be accounted for if these AFs are utilized.

The capacity for flaring DG is an important consideration because the flare needs to handle all the DG being produced in the event the Heat Dryer and Co-gen stop consuming DG. If an additional 12,000 therms/week of DG is produced (relative to May 2016 to April 2017 data), the total DG production is approaching the flare capacity. Therefore, an appropriate level of control over DG production via AF feed rates is needed to ensure DG production does not exceed the flare capacity. To reduce the risk of a DG venting incident, some agencies in Southern California have connected carbon canisters to the digester pressure relief valves to scrub hydrogen sulfide from any DG released, thus avoiding a permit violation during short-term increases in DG pressure.

### 4.3 Solids Dewatering and Drying

Highly biodegradable AFs like FOG and Dewatered LT Drip do not result in additional solids to be dewatered. In fact, they can lead to enhanced digestion of the wastewater solids, resulting in an overall reduction of solids to dewater relative to no AF co-digestion. This may not be the case for other AFs (e.g., FW slurry and brewery spent yeast). Testing would be needed to determine the VSR of these AFs, and the resulting impact on the solids content of the digested sludge.

# **4.4 Centrate Quality**

The impact of AF co-digestion on the quality of centrate (or other return streams) has not been reported widely. The co-digestion of nitrogen-rich AFs would likely increase the ammonia content of the centrate being returned to the head of the plant. This would be significant for a nitrifying plant. For a non-nitrifying plant like the EWPCF, the impact may be minor.

Since digestion at thermophilic temperature was mentioned previously as an option to increase the VS/organic loading capacity, it should be noted that thermophilic digestion typically has a negative impact on centrate quality in terms of solids and organic content. The digested sludge floc characteristics in thermophilic digestion result in a lower solids capture in the dewatering process.

### 5. RECOMMENDATIONS

Recommendations for the AF loading strategy and process monitoring are presented in this section.

### **5.1 Alternative Fuel Loading Strategy**

The key to the AF loading strategy is the target for the additional DG to be produced. As described in Section 4, this target is about 12,000 therms/week. It is recommended to prioritize FOG and Dewatered LT Drip to achieve the DG production target since these AFs are the most effective at producing DG with little risk of causing digester instability. Also, FOG and Dewatered LT Drip are not expected to increase the solids loading to the dewatering process or degrade the quality of the centrate. The quantities of FOG and Dewatered LT Drip needed to produce about 12,000 therms/week are consistent with the reported availability of these AFs from current suppliers. Guidance has also been given that FOG from another supplier, in significant quantities that undergo more quality control, is readily available. A practical

concern of FOG injection is the potential for FOG to congeal and plug piping. Fortunately, the AFRF was designed with relatively short pipe runs and a hot water flush system to address this concern. If the co-digestion of spent yeast and/or FW slurry is pursued, a thorough testing phase is recommended in which the loading rate of the AF is gradually ramped up to assess the process impacts. The main reasons for this are the potential for ammonia production in the digesters, and the potential to increase solids loading to dewatering and the dryer. A test period of three months or more in a digester dedicated to the co-digestion of the AF of interest is desirable to collect a representative body of data.

Before additional AF is received, an evaluation of the flare's ability to operate near its design capacity is recommended. Depending on this outcome, a determination can be made on whether the system's ability to respond to the various modes of failure will be acceptable if more DG is produced.

### AF Strategy Summary:

- Prioritize FOG and Dewatered LT Drip to achieve target of 12,000 therms/week
- Evaluate flare's ability to operate near design capacity
- Testing phase recommended for spent yeast
- Testing phase recommended for FW slurry

### **5.2 Process Monitoring**

The process monitoring parameters currently measured for the digestion system are comprehensive. These parameters and typical values are shown in Table 4.

able 4	Гуріса	i Data i	or Digester	Operation	(iviay	2016 to	April 2017)	1

Parameter	units	Average	Min	Max
Primary sludge to digesters	gal/day	166,402	146,869	189,562
Primary sludge TS	%	4.23	3.57	5.20
Primary sludge VS	%	86.78	82.60	87.85
TWAS to digesters	gal/day	84,279	77,889	95,341
TWAS TS	%	5.70	4.96	6.25
TWAS VS	%	80.10	78.00	82.40
Digester HRT	days	17.30	15.81	19.23
Digester Temperature	deg F	97.08	96.94	97.23
pH (digested sludge)	n/a	7.07	6.94	7.12
Alkalinity (digested sludge)	mg/L as CaCO3	4,834	4,438	5,283
VFA (digested sludge)	mg/L	226.00	165.00	276.00
NH3-N (digested sludge)	mg/L	n/a	n/a	n/a
VSR	%	54.66	46.62	60.21
Biogas production	cu ft/day	739,367	668,760	816,099
Methane content (digester gas)	%	58.60	55.37	61.34
H2S (digester gas)	ppm	180	100	275

The current monitoring should continue, and if an AF containing appreciable levels of nitrogen (e.g., protein) is co-digested, then monitoring the ammonia nitrogen concentration in the digested sludge (or centrate) is also recommended. When changes to the type of AF or changes to the loading rate are made, it is recommended to increase the frequency of measurements done in the lab from once per week to two or three times per week until the new steady state is reached (approximately 1 month). When considering an AF for co-digestion, characterizing the AF according to Table 5 is also recommended.

**Table 5 Recommended AF Characterization Data** 

Parameter	units	Alternative Fuel Value	Notes/Comments
Source/AF Type	n/a		Describe the source of material
Quantity	gal/day		Provide the expected quantity of waste material
TS	%		Total Solids
VS	% of TS		Volatile Solids
TDS	mg/L		Total Dissolved Solids
COD (total)	mg/L		Total Chemical Oxygen Demand
COD (soluble)	mg/L		Soluble Chemical Oxygen Demand
рН	n/a		
Alkalinity	mg/L as CaCO3		
VFA	mg/L		Volatile Acids
TN	mg/L		Total Nitrogen
TKN	mg/L		Total Kjeldahl Nitrogen
NH <sub>3</sub> -N	mg/L		Ammonia Nitrogen
TOC	mg/L		Total Organic Carbon
Phosphate as P	mg/L		
Phosphorus (total)	mg/L		
Sulfide (total)	mg/L		
Sulfide (soluble)	mg/L		
H <sub>2</sub> S	mg/L		Hydrogen Sulfide
Sulfate	mg/L		
Protein content	%		
Fat content	%		
Carbohydrates	%		
C:N	mass ratio		Carbon to Nitrogen Ratio
ВМР	volume of methane per mass of VS		Biomethane Potential
Viscosity	centistokes (cSt)		kinematic viscosity or other measure of viscosity

Knowing the composition of the AF is important for understanding the potential for digester instability and determining initial loading rates for co-digestion. For example, three different AFs from a local brewery known as Raw Spent Yeast, Dewatered Spent Yeast, and Dewatered LT Drip (same AF mentioned

in Section 1.2), were analyzed for the parameters shown in Table 5 (except BMP) in July 2017. The Dewatered Spent Yeast is the liquid fraction produced from a solids removal process on Raw Spent Yeast, and Dewatered LT Drip is the liquid fraction resulting from a solids removal process on LT Drip. The results of this analysis are presented in Table 6.

**Table 6 Brewery Waste Characterization Data** 

Parameter	units		Alternative Fuel Value	е
Source/AF Type	n/a	Raw Spent Yeast	Dewatered Spent Yeast	Dewatered LT Drip
Quantity	gal/day	-	-	-
TS	%	11	1.4	5.1
VS	% of TS	>99	86	98
TDS	mg/L	11,000	9,800	35,000
COD (total)	mg/L	110,000	50,000	59,000
COD (soluble)	mg/L	58,000	52,000	60,000
pН	n/a	4.4	5	4.8
Alkalinity	mg/L as CaCO3	ND	120	110
VFA	mg/L	2,100	660	227
TN	mg/L	1,200	360	340
TKN	mg/L	1,200	350	340
NH <sub>3</sub> -N	mg/L	44.3	19.3	25.3
TOC	mg/L	24,000	11,000	15,000
Phosphate as P	mg/L	160	120	130
Phosphorus (total)	mg/L	370	100	140
Sulfide (total)	mg/L	ND	ND	ND
Sulfide (soluble)	mg/L	ND	ND	ND
H <sub>2</sub> S	mg/L	ND	ND	ND
Sulfate	mg/L	210	190	240
Protein content	%	2.98	0.19	0.18
Fat content	%	1.17	0.4	0.18
Carbohydrates	%	8.76	1.02	4.22
C:N	mass ratio	13:1	27:1	4:1
ВМР	volume of methane per mass of VS	-	-	-
Viscosity	Bostwick (cm @ 30 sec)	2.5	>23	>23

Based on the data in Table 6, the Dewatered Spent Yeast and Dewatered LT Drip have similar characteristics, which suggests their behavior as an AF in co-digestion would be similar. Relative to the brewery wastes that went through a solids removal process, the Raw Spent Yeast has a higher potential

for causing digester instability due to the significantly higher protein content (i.e., 2.98% compared to less than 0.2%).

To ensure the composition of AFs stays within acceptable limits, the development of a specification for each type of AF is recommended to include in the contract with the AF supplier. An enforceable AF specification that defines all the appropriate limits for AF quality will add to the success of the codigestion program.

### Mesophilic Digestion with Digesters 1-6

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not ap	plicable)		
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Biogas production yield (scf/lb-VS .)	18	1	FOG Ringas production yield (scf/lb-VSd)	17.8	1	

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Digester voiaule collus Reduction (vor.)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row					

Nutrients Speciation for Existing Conditions

Primary Sludge			TWAS			Existing HSOW (if applicable)		
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Nitrogen Speciation			Nitrogen Speciation			Nitrogen Speciation		
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		

Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Speciation		
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (Ib-N/Ib-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

Table X-X: Existing Mesophilic Digestion with Digesters 1					4	
	Annual Average	Peak Month	Peak 14 day	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	4.75	4.75	4.75	4.75	4.75	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.

### 15 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1			Peak Month	1.23	2	
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Canture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Ringas production yield (scf/lh-VS.)	19	1	EOC Ringse production yield (ccf /lb.VSd)	17.9	- 1	

#### High Strength Organic Waste (HSOW)

riigii Gadiigai Gigaiile Hasse (1100H)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester volatile contas reduction (vort)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3

### 15 day Thermophilic Digestion with All digesters in service

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)		
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Ringas production yield (scf/lb-VSd)	17.8	1

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)				•	

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were

### 10 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Canture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb.VSd)	17.8	1	

#### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester Foldule Colles Reduction (FOR)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row	]				
FOG VSR (%) SSO VSR (%)	90%	3	Syllergysuc ilicrease ili Sullus neuucuuli ( 8)		

#### Nutrients Speciation for Existing Conditions

reducing openiques for Describ contracts								
Primary Sluc	ige		TWAS			Existing HSOW (if applicable)		
Parameter	Input Values	Reference	Parameter Input Values Reference		Parameter	Input Values	Reference	
Nitrogen Speci	ation		Nitrogen Spec	iation		Nitrogen Speciation	Nitrogen Speciation

# 10 day Thermophilic Digestion with All digesters in service

Digester and	<b>Process</b>	Information
--------------	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	Minium HRT (days) 10 Assumed F		Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)		
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS d)	18	1	FOG Biogas production yield (scf/lb-VSd)	17.8	1

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were

### Mesophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Didector pH	7.05	1	Dewatering Canture Date (%)	95%	1	Dook day	1.6	2

### Digester Sludge Feed

Par	imeter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Slu	ige Flow (gpd)	177,844	1	Use if facility already receives HSO	OW (blank if not applicable)		
Primary Sludg	Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge	Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS	low (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	
TWAS Tot	al Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Vola	ile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Biogas	production yield (scf/lb-VS <sub>d</sub> )	18	1	FOG Biogas production yield (scf/lb-VSd)	17.8	1	

#### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
USOW No. 2 Volatile Solide (%)					

#### Digester Volattle Solids Reduction (VSR)

Digester Foldule Colles Reduction (FOR)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3

# Mesophilic Digestion with Digesters 1-6

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1			Peak Month	1.23	2	
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	W (blank if not applicable	)	
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	

High Strength Organic Waste (HSOW)

Parameter	Input Values Reference		Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3

# 15 day Thermophilic Digestion with All digesters in service

Digester and	Process	Information
--------------	---------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days) 15 Assumed Peaking Factors					
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference Parameter		Input Values	Reference	Г
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	Use if facility already receives HSOW (blank if not applicable)		Ĺ
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	Ĺ
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	Ĺ
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	Ĺ
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		Ĺ
Domestic Sludge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this sum					

#### **Nutrients Speciation for Existing Conditions**

Primary Sludge			TWAS			Existing HSOW (if applicable)		
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Nitrogen Speciation		Nitrogen Spec	iation		Nitrogen Speciation			
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)	PS Soluble Nitrogen (lb-N/lb-TS)		TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		

#### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen S	Speciation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

	Table X		mophilic Digestion with All digesters in service	Feed Assessment		
	Annual Average	Peak Month	Peak Month	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	4.75	4.75	4.75	4.75	4.75	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.

# 10 day Thermophilic Digestion

#### Digester and Process Information

	Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
	Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
	Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Г	Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Г	Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
	Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
	Digostovali	7.05	1	Downtoring Conturn Boto (9/)	05%	1	Dook day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	W (blank if not applicabl	e)
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1

#### High Strength Organic Waste (HSOW)

riigii Gadiigai Gigaiile Hasse (1100H)						
Parameter	Input Values	Reference	Parameter	Input Values	Reference	
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed	
HSOW No. 2 Name			Percent of (%)	0%		
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed	
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)			
HSOW No. 2 Total Solids (%)						
HSOW No. 2 Volatile Solids (%)						

#### Digester Volatile Solids Reduction (VSR)

Digester volatile colles reduction (vort)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row					

#### Nutrients Speciation for Existing Conditions

reducing openiques for Describ contracts	ations operation for Easting continuous										
Primary Sludge			TWAS			Existing HSOW (if applicable)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference			
Nitrogen Speci	ation		Nitrogen Spec	iation		Nitrogen Speciation					
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)			
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)					
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)					

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

			xisting 10 day Thermophilic Digestion Feed A	ssessment		
	Annual Average	Peak Month	Peak Month	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	3.90	3.90	3.90	3.90	3.90	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.
Primary Sludge Total Solids Load (lb-TS/d)	60,812	74,799	79,056	85,137	97,299	
TWAS Total Solids Load (lb-TS/d)	37,020	45,534	48,125	51,827	59,231	
FOG Total Solids Load (lb-TS/d)	3,991	3,991	3,991	3,991	3,991	
Total Digester Feed, Total Solids Load (lb-TS/d)	101,822	124,324	131,172	140,955	160,521	
Primary Sludge Volatile Solids Load (lb-VS/d)	52,906	65,075	68,778	74,069	84,650	
TWAS Volatile Solids Load (lb-VS/d)	29,616	36,427	38,500	41,462	47,385	
FOG Volatile Solids Load (lb-VS/d)	3,193	3,193	3,193	3,193	3,193

## 10 day Thermophilic Digestion with All digesters in service

Digester and	<b>Process</b>	Information
--------------	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	W (blank if not applicable)		
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### ster Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were

### Mesophilic Digestion

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Didector pH	7.05	1	Dewatering Canture Date (%)	95%	1	Deak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSO	W (blank if not applicabl	e)
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester voiatie contes reduction (vorc)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3

## Mesophilic Digestion with Digesters 1-6

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference Parameter		Input Values	Reference
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)		
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS .)	18	1	FOG Ringas production yield (scf/lb-VSd)	17.8	1

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row					

Nutrients Speciation for Existing Conditions

Primary Sludge			TWAS			Existing HSOW (if applicable)		
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Nitrogen Speciation			Nitrogen Speciation			Nitrogen Speciation		
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		

Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Speciation		
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

Parallel Operation of Digesters
Table X-X: Existing Mesophilic Dig

Table X-X: Existing Mesophilic Digestion with Digesters 1						
	Annual Average	Peak Month	Peak 14 day	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	6.70	6.70	6.70	6.70	6.70	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.

# 15 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days) 15 Assumed Peaking Factors					
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1			Peak Month	1.23	2	
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Canture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1	

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester voiatile contas reduction (voit)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row					

#### Nutrients Speciation for Existing Conditions

reducing openiques for Describ contracts	realions operation for Easting Continuous									
Primary Sludge			TWAS			Existing HSOW (if applicable)				
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference		
Nitrogen Speciation			Nitrogen Speciation			Nitrogen Speciation				
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)		
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)				
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)				

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (Ib-N/Ib-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (Ib-N/Ib-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

Table X-X: Existing 15 day Thermophilic Digestion Feed Assessmen								
	Annual Average	Peak Month	Peak 14 day	Peak 7 day	Peak day	Notes		
Peaking Factors	1.00	1.23	1.30	1.40	1.60			
Digester Volume (MG)	5.84	5.84	5.84	5.84	5.84	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.		
Primary Sludge Total Solids Load (lb-TS/d)	48,007	59,049	62,410	67,210	76,812

## 15 day Thermophilic Digestion with All digesters in service

Digester and	<b>Process</b>	Information
--------------	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days) 15 Assumed		Peaking Factors			
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values Reference Parameter		Input Values	Reference			
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSO	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1		
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	i	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	i	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	i	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		i	
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	i .	

#### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HCOW No. 2 Volotile Calide (9/)					

#### Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were					

#### Nutrients Speciation for Existing Condition

Nutrielle Speciation for Existing Continuous

### 10 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1			Peak Month	1.23	2	
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Canture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSO	W (blank if not applicabl	e)
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1

#### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
USOW No. 2 Volatile Solide (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester Foldule Colles Reduction (FOR)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row	]				
FOG VSR (%) SSO VSR (%)	90%	3	Syllergysuc ilicrease ili Sullus neuucuuli ( 8)		

#### Nutrients Speciation for Existing Conditions

Nucleille Speciation for Existing Conditions								
Primary Slud	Primary Sludge					Existing HSOW (if applicable)		
Parameter Input Values Reference		Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Nitrogen Speciation			Nitrogen Spec	ation		Nitrogen Speciation		
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (Ib-N/Ib-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		
						·		

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

			#REF!			
	Annual Average	Peak Month	Peak 14 day	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	5.84	5.84	5.84	5.84	5.84	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.
Primary Sludge Total Solids Load (lb-TS/d)	48,007	59,049	62,410	67,210	76,812

## 10 day Thermophilic Digestion with All digesters in service

Digester and	<b>Process</b>	Information
--------------	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSO	W (blank if not applicable)	)	i
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	i
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	i
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	i
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		i
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	i .

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were

## Thermal Hydrolysis with Mesophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	12	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.4	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1	Percent Solids Content of Digester Feed	9%	Assumed	Peak Month		2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	102	Assumed	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day		2
DidoctornU	7 OF	- 1	Downtoring Conture Rate (9/)	0.59/	1	Dook dov	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	140,397	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	60,000	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Ringas production yield (scf/lh-VS.)	19	1	EOC Ringse production yield (ccf /lb.VSd)	17.9	- 1	

#### High Strength Organic Waste (HSOW)

riigii Gadiigai Gigaiile Hasse (1100H)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0		Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester voiatile contas reduction (voit)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row

## Mesophilic Digestion with Digesters 1-6

Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.18	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	97	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS) 22% 1		Peak 7 day	1.4	2	
Digester nH	7.05	1	Dewatering Capture Rate (%)			1.6	2	

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	W (blank if not applicable	)
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS d)	18	1	FOG Biogas production yield (scf/lb-VSd)	17.8	1

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were					

Nutrients Speciation for Existing Conditions

## 15 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days) 15 Assumed Peaking Factors					
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSO	e if facility already receives HSOW (blank if not applicable)	
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1

#### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester Foldule Colles Reduction (FOR)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row	]				
FOG VSR (%) SSO VSR (%)	90%	3	Syllergysuc ilicrease ili Sullus neuucuuli ( 8)		

#### Nutrients Speciation for Existing Conditions

Number of Page 19 and 1								
Primary Slud	Primary Sludge				Existing HSOW (if applicable)			
Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Nitrogen Specia	ation		Nitrogen Speciation		Nitrogen Speciation			
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)	Ib-N/Ib-TS) TWAS Soluble Nitrog		TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

		Table X-X: E	kisting 15 day Thermophilic Digestion Feed A	Assessment		
	Annual Average	Peak Month	Peak Month	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	5.84	5.84	5.84	5.84	5.84	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.
Primary Sludge Total Solids Load (lb-TS/d)	60,812	74,799	79,056	85,137	97,299	
TWAS Total Solids Load (lb-TS/d)	37,020	45,534	48,125	51,827	59,231	
FOG Total Solids Load (lb-TS/d)	3,991	3,991	3,991	3,991	3,991	
Total Digester Feed, Total Solids Load (lb-TS/d)	101,822	124,324	131,172	140,955	160,521

Encina Biosolids, Energy, and Emissi	ons		2030 Year - All Digester	s in Service	

## 15 day Thermophilic Digestion with All digesters in service

Digester	and	<b>Process</b>	Information
----------	-----	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	15	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester pH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge Flow (gpd)	177,844	1	<ol> <li>Use if facility already receives HSOW (blank if not applicable)</li> </ol>		)
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS .)	19	1	FOG Ringas production yield (scf/lb-VSd)	17.8	1

High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

Digester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were					

**Nutrients Speciation for Existing Conditions**

## 10 day Thermophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)			Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Canture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Sludge Biogas production yield (scf/lb-VS.)	19	- 1	FOG Ringas production yield (scf/lb-VSd)	17.8	- 1	

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HCOW No. 2 Volotile Colide (9/)	i e		1		

#### Digester Volatile Solids Reduction (VSR)

Digester Foldule Colles Reduction (FOR)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not use this row	]				
FOG VSR (%) SSO VSR (%)	90%	3	Syllergysuc ilicrease ili Sullus neuucuuli ( 8)		

#### Nutrients Speciation for Existing Conditions

Nucleille Speciation for Existing Conditions								
Primary Sludge			TWAS			Existing HSOW (if applicable)		
Parameter	Input Values	Reference	Parameter Input Values Reference		Parameter	Input Values	Reference	
Nitrogen Speciation			Nitrogen Speciation			Nitrogen Speciation		
PS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)
PS Org. Nitrogen (lb-N/lb-TS)			TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (Ib-N/Ib-TS)		
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)		
			<u> </u>			·		

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000

Encina Biosolids, Energy, and Emissions			2030 Year - All Digesters in Service			

## 10 day Thermophilic Digestion with All digesters in service

Digester and	<b>Process</b>	Information
--------------	----------------	-------------

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter	Input Values	Reference
Number of Primary Digesters	3	1	Minium HRT (days)	10	Assumed	Peaking Factors		
Number of Secondary Digesters	3	1	Maxium OLR (lbs-VS/cf-d)	0.35	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1				Peak Month	1.23	2
Volume of Secondary Digesters (MG)	0.3	1	Digester Temperature (F)	151	1	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day	1.4	2
Digester nH	7.05	1	Dewatering Capture Rate (%)	95%	1	Peak day	1.6	2

### Digester Sludge Feed

Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Primary Sludge Flow (gpd)	177,844	1	Use if facility already receives HSOW (blank if not applicable)			
Primary Sludge Total Solids (%)	4.1%	1	HSOW Name	FOG	1	
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1	
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1	
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2	
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No		
Domestic Studge Biogas production yield (scf/lb-VS a)	18	1	FOG Biogas production yield (scf/lh-VSd)	17.8	1	

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### tester Volatile Solids Reduction (VSR)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3			
Do not we able were					

numents opeciation for existing conditions									
Prima	Primary Sludge			TWAS			Existing HSOW (if applicable)		
Parameter			Parameter	Input Values	Reference	Parameter	Input Values	Reference	
Nitrogen Speciation			Nitrogen Speciation			Nitrogen Speciation			
PS Total Nitrogen (lb-N/lb-TS) 0.065 6 (TKN Content)		TWAS Total Nitrogen (lb-N/lb-TS)	0.065	6 (TKN Content)	Existing HSOW Total Nitrogen (lb-N/lb-TS)	0.010	6 (TKN Content)		
PS Org. Nitrogen (lb-N/lb-TS)	PS Org. Nitrogen (Ib-N/Ib-TS)		TWAS Org. Nitrogen (lb-N/lb-TS)			Existing HSOW Org. Nitrogen (lb-N/lb-TS)			
PS Soluble Nitrogen (lb-N/lb-TS)			TWAS Soluble Nitrogen (lb-N/lb-TS)			Existing HSOW Soluble Nitrogen (lb-N/lb-TS)			

#### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen S	Speciation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

Peaking Factors  Digester Volume (MG)  Primary Sludge Total Solids Load (Ib-TS/d)  TWAS Total Solids Load (Ib-TS/d)	Annual Average 1.00 6.70	Peak Month 1.23	Peak Month 1.30	Peak 7 day 1.40	Peak day 1.60	Notes
Digester Volume (MG)  Primary Sludge Total Solids Load (lb-TS/d)		1.23	1.30	1.40	1.60	
Primary Sludge Total Solids Load (lb-TS/d)	6.70					
		6.70	6.70	6.70	6.70	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.

## Thermal Hydrolysis with Mesophilic Digestion

#### Digester and Process Information

Parameter	Input Values	Reference	Parameter	Input Values	Reference	Parameter Input Va		Reference
Number of Primary Digesters	3	1	Minium HRT (days)	12	Assumed	Peaking Factors		
Number of Secondary Digesters			Maxium OLR (lbs-VS/cf-d)	0.4	Assumed	Annual Average	1	2
Volume of Primary Digesters (MG)	2.05	1	Percent Solids Content of Digester Feed	of Digester Feed 9% Assumed Peak Month		1.23	2	
Volume of Secondary Digesters (MG)			Digester Temperature (F)	102	Assumed	Peak 14 day	1.3	2
Digester Effliency Allowance (%)	5%	Assumed	Dewatering Total Solids (%TS)	22%	1	Peak 7 day 1.4		2
Didector nil	7.05	1	Dewatering Canture Pate (%)	95%	1	Dook day	1.6	2

### Digester Sludge Feed

Parameter	Input Values Reference Parameter		Input Values	Reference	
Primary Sludge Flow (gpd)	177,844	<ol> <li>Use if facility already receives HSOW (blank if not applicable)</li> </ol>			e)
Primary Sludge Total Solids (%)	4.1% 1 HSOW Name		HSOW Name	FOG	1
Primary Sludge Volatile Solids (%)	87%	1	FOG Flow (gpd)	8,700	1
TWAS Flow (gpd)	79,264	1	FOG Total Solids (%)	5.5%	1
TWAS Total Solids (%)	6%	1	FOG Volatile Solids (%)	80%	2
TWAS Volatile Solids (%)	80%	1	Are peaking factors applied to FOG?	No	
Domestic Sludge Biogas production yield (scf/lb-VS.)	18	1	FOG Ringas production yield (scf/lb <sub>4</sub> VSd)	17.8	1

### High Strength Organic Waste (HSOW)

Parameter	Input Values	Reference	Parameter	Input Values	Reference
HSOW No. 1 Name	SS0	0	Percent of SSO (%)	100%	Assumed
HSOW No. 2 Name			Percent of (%)	0%	
SSO Total Solids (%)	12%	4	SSO Biogas production yield (scf/lb-VSd)	18	Assumed
SSO Volatile Solids (%)	85%	4	HSOW No. 2 Biogas production yield (scf/lb-VSd)		
HSOW No. 2 Total Solids (%)					
HSOW No. 2 Volatile Solids (%)					

#### Digester Volatile Solids Reduction (VSR)

Digester volatile contas reduction (vort)					
Parameter	Input Values	Reference	Parameter	Input Values	Reference
Primary Sludge VSR (%)	65%	3	Account for Synergystic Affects?	No	
TWAS VSR (%)	47%	3	Synergystic Increase in Solids Reduction (%)		
FOG VSR (%)	90%	3			
SSO VSR (%)	90%	3

### Nutrients Speciation for HSOW

Parameter	Input Values	Reference
Nitrogen Specia	ation	
SSO Total Nitrogen (lb-N/lb-TS)	0.063	4
HSOW No. 2 Total Nitrogen (lb-N/lb-TS)		
SSO Org. Nitrogen (lb-N/lb-TS)	0.058	4
HSOW No. 2 Org. Nitrogen (lb-N/lb-TS)		
SSO-Soluble Nitrogen (lb-N/lb-TS)	0.005	4
HSOW No. 2 Non-Soluble Nitrogen (lb-N/lb-TS)		
Maximum alloawable ammonia-N concentration (mg-N/L)	3,000	

	Tal		Thermal Hydrolysis with Mesophilic Digestion	Feed Assessment		
	Annual Average	Peak Month	Peak 14 day	Peak 7 day	Peak day	Notes
Peaking Factors	1.00	1.23	1.30	1.40	1.60	
Digester Volume (MG)	5.84	5.84	5.84	5.84	5.84	Service condition assumes largest digester is out of service with the active volume of each digeser reduced to account for process inefficiencies.
Primary Sludge Total Solids Load (lb-TS/d)	60,812	74,799	79,056	85,137	97,299	
TWAS Total Solids Load (lb-TS/d)	37,020	45,534	48,125	51,827	59,231	
FOG Total Solids Load (lb-TS/d)	3,991	3,991	3,991	3,991	3,991	
Total Digester Feed, Total Solids Load (lb-TS/d)	101,822	124,324	131,172	140,955	160,521	
Primary Sludge Volatile Solids Load (lb-VS/d)	52,906	65,075	68,778	74,069	84,650	
TWAS Volatile Solids Load (lb-VS/d)	29,616	36,427	38,500	41,462	47,385	
FOG Volatile Solids Load (lb-VS/d)	3,193	3,193	3,193	3,193	3,193	
Total Digester Feed, Volatile Solids Load (lb-VS/d)	85,715	104,695	110,471	118,724	135,228

## **Technical Memorandum**

FINAL

9665 Chesapeake Drive, Suite 201 San Diego, CA 92123

T: 858.514.8822 F: 858.514.8833

Prepared for: Encina Wastewater Authority

Project Title: Biosolids, Energy and Emissions

Project No.: 150871.005.001

#### Technical Memorandum No. 5

Subject: Technology Evaluation for Waste Heat

Date: December 22, 2017

To: Scott McClelland, Assistant General Manager

From: Scott Lacy, Project Manager

Prepared by:

## **Executive Summary**

The Encina Water Pollution Control Facility (EWPCF) currently has four 750-kilowatt (kW) (nameplate) internal combustion (IC) engines and a biosolids dryer, both of which produce heat. Recovered heat is utilized by the anaerobic digesters and an absorption chiller serving the Power Building while the remaining heat is wasted to plant effluent and atmosphere. This Technical Memorandum (TM) 5 provides an evaluation of alternative technologies for increasing heat utilization. The waste heat utilization technologies evaluated in this TM include:

- Absorption and adsorption chillers
- Organic Rankine Cycle (ORC)
- Small-scale steam turbines
- Gasification of biosolids
- Thermophilic digestion or thermal hydrolysis process (THP)

Screening and ranking of technologies was performed in a workshop with Encina Wastewater Authority (EWA) staff on August 16, 2017. The project team applied a fatal-flaw test to all alternatives and technologies that did not pass the fatal-flaw filter were eliminated. Technologies that passed the fatal-flaw filter, namely thermophilic digestion/thermal hydrolysis process (THP) and small-scale steam turbines, were assessed using evaluation criteria developed to reflect EWA's values and goals for the project (Table ES-1). Heat utilization alternatives that received an overall score of 3 or higher in the scoring evaluation will be further refined and analyzed using Brown and Caldwell's (BC's) Solids Water Energy Evaluation Tool (SWEET).

## **Section 1: Introduction**

EWA has undertaken a Biosolids Energy and Emissions Plan (BEE Plan) which will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- 1. Provide a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat;
- 2. Address capacity limitations in the solids handling process at the EWPCF;
- 3. Assess which alternative is likely to be the most cost effective and sustainable solution for EWA;
- 4. Move the EWPCF toward greater energy independence; and
- 5. Reduce greenhouse gas emissions.

The purpose of TM 5 is to conduct a technology screening for increasing heat utilization for a beneficial purpose rather than wasting it. This TM does not provide an alternatives analysis, but does provide insight to the methodology and rationale used to select alternatives which will move forward for further analysis in the SWEET model development.

## 1.1 Purpose and Scope

This TM is preceded by TM 1 which addressed the baseline energy and heat profiles and projections, established a mass balance for the solids handling system, and evaluated sludge flows and loads projections performed under the Process Master Plan. Screening and evaluation of solids processing and

power production technologies are described in TMs 1, 2 and 3, including derivation of the heat projections used in the alternatives evaluation presented in this TM.

TM 5 summarizes the methodology for screening and evaluating heat utilization technologies, the technologies evaluated, and how these alternatives were ranked to determine which would move forward in the SWEET analysis. Recommended technologies will be advanced for further analysis and will be combined with the solids handling and waste heat alternatives presented in TMs 2 and 3. Screening and ranking of technologies were performed in a workshop with EWA staff on August 16, 2017. Meeting minutes from this workshop have been provided as Attachment A.

## 1.2 Background Information

The EWA cogeneration system has four Caterpillar 3516 IC engine-generators installed in the Power Building; each engine-generator has a nameplate electrical output of 750 kW. One of the four IC engines at the EWPCF serves as a standby unit in the event another IC engine must be shut down. Thus, three IC engines are available for cogeneration.

IC engine operation is permitted by San Diego Air Pollution Control District. EWA received a revised air permit, dated November 8, 2017, allowing utilization for a total of 280 million standard cubic feet (scf) of digester gas (DG) and natural gas (NG) per year to fuel the IC engines. The permit limits NG consumption to 28 million scf per year (scf/year)—or 10 percent by volume. Under the previous air permit, EWA was allowed to utilize 224 million scf of DG and NG per year for the IC engines, and NG consumption could not exceed 22.4 million scf/year. The fuel consumption limits of the previous permit allowed only two of the four IC engines to be used during typical operation. However, there were times when the plant ran a third engine and physically disconnected from the grid during peak demand periods to avoid high power charges.

EWA pursued modifications to its air permit to allow the entire use of the current biogas in the IC engines and increase the generating capacity of the plant. A summary of current and future EWPCF biogas projections is shown in Table 1-1. These projections assume high strength waste (HSW) quantities do not increase and are discussed in greater detail in TM 1. The new air permit increases the DG and NG usage limit to approximately 533 scf per minute (scfm), which exceeds the current biogas production with the increased quantities of HSW the plant recently began accepting. As a result, the equivalent of 2.5 engines may be operated continuously; thus, increasing the amount of waste heat that can be recovered.

Table 1-1. Projected Biogas Production					
Unit Measurement Current 2020 2030 2040					
scfm	501	528	619	709	
therms/year <sup>1</sup>	1,581,000	1,666,000	1,951,000	2,235,000	

Based on 600 Btu/ft<sup>3</sup> LHV

Following TM 1, BC reevaluated the current heat production and demand values. The reevaluation suggests the existing mesophilic digesters likely require 2.1 to 2.4 million British thermal units (MMBtu) per hour (MMBtu/hr), total, rather than the initially estimated 1.2 MMBtu/hr. With the old permit, the engines recover around 5.3 MMBtu/hr rather than the initially estimated 6 MMBtu/hr. When the new permit conditions are applied, approximately 6 to 7 MMBtu/hr of heat can be recovered from the engines. A summary of these projections is provided in Table 1-2. Excess heat can be beneficially used for various purposes, which will be discussed in Section 2.

Table 1-2. Heat Production and Usage				
	Baseline TM 1		Revised Projections	
	Production, MMBtu/hr	Usage, MMBtu/hr	Production, MMBtu/hr	Usage, MMBtu/hr
Engines	6.0	-	6.0 - 7.0	-
Dryer/RT0	1.4	-	1.4	-
Digesters	-	1.2	-	2.3
Total	7.4	1.2	7.4 - 8.4	2.3

# Section 2: Identification of Technologies for Waste Heat Utilization Production

The BC team identified and evaluated technologies to utilize the excess heat generated by the IC engines. Alternative technologies include the following:

- Small scale steam turbines
- Thermophilic digestion or THP
- Absorption and adsorption chillers
- ORC
- Gasification of biosolids

These technologies are discussed in subsequent sections in further detail. The waste heat technologies were first screened using four fatal flaw criteria that were developed in conjunction with EWA staff. The four fatal flaw screening criteria include the following:

- 1. At least one successful North American installation of technology. There must be at least one full-scale installation of the technology at a wastewater treatment plant (WWTP) in North America.
- At least one successful installation and operation in a facility of similar size. The technology should be sufficiently developed that it is applicable at a facility of comparable size to EWPCF to ensure compatibility.
- 3. Available space. The technology must be accommodated within the limited available footprint at EWPCF.
- 4. **Compatibility with plant site and any existing equipment**. The technology must be capable of being integrated into the existing treatment plant infrastructure.

For an alternative to be considered for the ranking process, it must pass all four fatal flaw criteria.

#### 2.1 Small-Scale Steam Turbines

A small-scale steam turbine system uses a steam boiler to combust any excess DG and produce steam. Instead of using a pressure regulator to reduce the pressure of the outlet steam, a small back-pressure steam turbine and generator is installed to generate electricity. After passing through the turbine, steam can be used to transfer excess heat to the digesters or a THP system. A basic diagram of this process is presented in Figure 2-1. If steam is not consumed, it can be recycled in a Rankine cycle, which would require a condenser unit, waste heat removal, a pump, and other associated equipment.

Figure 2-1. Small-scale steam turbine system process flow diagram.

Engine waste heat can also be utilized in this process in a composite boiler to preheat boiler feed water upstream of where the water enters the DG or NG fired chamber. Preheating the feed water reduces DG or NG consumption. A simplified flow diagram of the small-scale steam turbine system with a composite boiler is shown in Figure 2-2.

Figure 2-2. Small-scale steam turbine system and composite boiler process flow diagram.

This type of small-scale steam turbine system has not been employed at any WWTPs in the U.S., but this process can be readily applied. These systems have been successfully installed by NLine Energy at hospitals and other large-scale industrial settings to take the place of pressure regulators in the steam heat systems. In addition, boilers and steam turbines are proven technologies, are available at competitive market prices,

and have a relatively small footprint. Small-scale steam turbines can be cost effective when paired with an existing steam system, but EWPCF only uses hot water for heating services. Adding a steam system for the sole purpose of running a steam turbine is not cost effective; a conceptual order of magnitude cost estimate for adding a steam system and steam turbine is \$1 million. Such a system would only be compatible at EWPCF if a process that requires steam, such as THP, is installed.

## 2.2 Thermophilic Digestion or Thermal Hydrolysis Process

Thermophilic digestion or THP would allow for additional utilization of engine waste heat, as well as benefits to the digestion process. These alternate solids stabilization technologies are summarized in greater detail in TM 2.

Thermophilic digestion, which selects organisms with favorable digestion kinetics at thermophilic temperatures targeted at 135 degrees Fahrenheit, is an alternative to the existing mesophilic digestion which operates between 95 and 100 degrees Fahrenheit. To achieve thermophilic temperatures, additional engine exhaust heat would need to be recovered through the plant hot water loop and transferred to the digesters via installing more heat exchangers and larger hot water pumps. It should also be noted that the temperature of the hot water needed for thermophilic digestion is generally higher than for mesophilic digestion, and recoverable heat drops as the recovery temperature rises. A more detailed evaluation should be performed to determine how much heat would be available from the existing engines if thermophilic digestion is considered further. Changes to the overall heat loop may be required, as well. Other treatment plants that recover engine waste heat for thermophilic digestion include Hyperion in Los Angeles, California; East Bay Municipal Utilities District in Oakland, California; Oceanside Treatment Plant in San Francisco, California; and the Annacis Island Treatment Plant in Vancouver, British Columbia.

In THP, sludge is heated to around 165 degrees Celsius (330 degrees Fahrenheit) at an elevated pressure using direct steam injection, followed by a sudden drop in pressure. This process improves digestion performance by breaking down sludge to make it more accessible to microbes during digestion. In general, IC engine exhaust heat is a poor source for making steam, while boilers and gas turbines have had more success. Exhaust heat from IC engines can, however, be utilized to preheat feedwater prior to producing steam in a boiler for THP or in a composite boiler.

Modifying EWPCF to accommodate a THP system would require a larger footprint than upgrading the mesophilic digesters to thermophilic digesters because THP requires additional ancillary equipment. However, as stated in TM 2, the EWPCF has room to accommodate the additional footprint of a THP system. Heat recovery equipment that would be associated with THP (i.e., steam or composite boilers) would have a relatively minor footprint. If steam boilers are used, a heat exchanger would be required to transfer waste heat from the IC engine to the boiler feedwater. If a composite boiler is used, engine exhaust could be introduced directly to the boiler to increase the feedwater temperature and reduce the DG or NG requirement. Multiple manufacturers have developed THP systems (Cambi, Veolia, etc.) at municipal WWTPs in the U.S. and Europe. For example, the District of Columbia Water and Sewer Authority (DC Water) in Washington, D.C. has a Cambi THP system which uses cogeneration steam to provide heat for the Cambi process.

There are multiple plants that operate thermophilic digesters or THP systems using waste heat from IC engines that have been in operation for longer than 5 years. The additional heat recovery equipment required for THP (e.g., heat exchangers, pumps, and boilers) has a relatively small physical footprint and can be installed within available space at EWPCF. If advanced digestion technologies are selected as part of the stabilization technology, waste heat from the engines can be recovered for a beneficial purpose. For these reasons, thermophilic digestion or THP passes the fatal flaw filter.

## 2.3 Absorption and Adsorption Chillers

Recovered heat from IC engines can also be used as part of the refrigeration cycle of absorption and adsorption chillers. Hot water or steam gaining energy from the IC engine waste heat is used to vaporize a refrigerant which has been absorbed or adsorbed in the chiller so that it can be recycled after subsequent condensation.

Absorption and adsorption chillers operate under similar principles; the primary difference is the sorbent compound that is used to capture the vaporized refrigerant. Absorption chillers use a fluid absorbent whereas adsorption chillers use a solid adsorbent. A general absorption cycle process flow diagram is presented in Figure 2-3. Other important differences to consider are that adsorption chillers are typically more expensive and less efficient but have significantly longer life expectancies.

Figure 2-3. Absorption cooling process flow diagram.

Source: U.S. Department of Energy Fact Sheet.

Absorption and adsorption chillers can be applied as air conditioning systems or as chilling systems for equipment and processes. These two types of systems can be provided in various sizes and configurations with cooling capacities ranging from 4.5 kW to 5 megawatts (MW). The wide range of cooling capacities allows for adsorption and absorption chillers to utilize as much waste heat as needed. These technologies are proven and have been applied in various forms and industrial settings since the early 1900s.

BC understands that the plant is moving from adsorption chillers to a centralized heating, ventilation, and air conditioning (HVAC) systems; therefore, this alternative fails the fatal flaw filter on compatibility and will no longer be evaluated moving forward.

## 2.4 Organic Rankine Cycle

ORC is a thermodynamic process in which waste heat is transferred to an organic fluid with a boiling point lower than water at a constant pressure. The organic fluid then vaporizes and expands in a vapor turbine to drive a generator, producing electricity. Cooled vapor is then condensed back to liquid state and recycled through the system via a pump. Figure 2-4 shows a schematic of how the ORC process operates when interconnected with an IC engine. As presented in Figure 2-4, ORC systems require a substantial cooling water stream to condense the organic working fluid after it exits the turbine. Overall, ORC systems have a

relatively low efficiency in converting excess thermal energy to electrical power. Average overall ORC efficiencies are between 10 and 12 percent when applied at WWTPs for waste heat usage.

Figure 2-4. Process flow diagram detailing the ORC.

Source: ElectraTherm.

Turboden (Italian brand) and ElectraTherm (U.S. brand) are the two main manufacturers that supply ORC systems to the U.S. ORC systems have been installed at multiple WWTPs in Europe. In the U.S., ORC systems have been installed at biomass processing plants and oil and gas operations but only one WWTP—the Albany County Sewer District (ACSD) North Plant in New York. The ACSD North Plant is a 35-million gallons per day (mgd) WWTP, similar in size to the EWPCF, and waste heat is generated by sludge combustion in an incinerator. The generated waste heat is used to create steam and run ACSD North Plant's Turboden ORC system, which has an installed capacity of 925 kW. The ACSD North Plant ORC application is not analogous to an ORC process that uses waste heat from an internal combustion engine because engine cogeneration produces significantly less heat than incineration at this scale.

The ORC is still considered an emerging technology with limited operating experience at WWTPs similar in size to EWA's; therefore, ORC does not pass the fatal flaw filter. Additionally, the parasitic loads associated with the large cooling water flow requirement significantly reduce the benefits provided by an ORC system.

#### 2.5 Gasification of Biosolids

Gasification of biosolids is a high temperature, thermal conversion process that produces a combustible gas mixture of hydrogen, carbon monoxide, and carbon dioxide. Gasification at EWPCF would take biosolids exiting the thermal dryer and combine them with waste heat from the IC engines to perform the reaction. The end products of gasification are ash and syngas, which is a combustible gas with a lower heating value between 100 and 300 Btu per standard cubic foot. Syngas can likely be used in the IC engines but would require upstream conditioning and engine modification for the very low Btu fuel.

Gasification of biosolids is still considered an emerging technology because there are not full-scale installations at municipal WWTPs. The plant in Sanford, Florida, recently ceased operations because the solids processing company (Maxwest Environmental) filed for bankruptcy. With the limited operating history, gasification of biosolids does not pass the fatal flaw filter.

#### 2.6 Fatal Flaw Conclusions

Waste heat technologies that pass the fatal flaw criteria include small-scale steam turbines and recovery of waste heat for thermophilic digestion or thermal hydrolysis. Both technologies have been successfully operated at WWTPs and align with the existing systems at EWPCF and available plant area. These alternatives are ranked using the evaluation and scoring criteria in Section 3 to determine if they should be analyzed further using BC's SWEET tool.

Absorption and adsorption chillers fail the fatal flaw filter because EWA plans to replace the existing adsorption chillers with a central HVAC system. ORC systems and biosolids gasification fail the fatal flaw filter because both technologies have limited operating experience at large-scale WWTPs.

The results of the fatal flaw evaluation are provided in Table 2-1.

Table 2-1. Waste Heat Technology Fatal Flaw Evaluation				
	Technology Maturity	Successful Operation	Available Space	Compatibility
Small-Scale Steam Turbines	Pass	Pass	Pass	Pass
Use for Thermophilic Digestion/THP	Pass	Pass	Pass	Pass
Absorption and Adsorption Chillers	Pass	Pass	Pass	Fail
ORC	Fail	Fail	Pass	Pass
Gasification of Biosolids	Fail	Fail	Pass	Pass

## **Section 3: Ranking of Screened Technologies**

This section describes the results of applying the evaluation criteria described in Section 2 to further screen and rank the technologies that passed the fatal flaw filter.

#### 3.1 Introduction

Following application of the fatal flaw filter, Table 3-1 summarizes the technologies that were further evaluated using established criteria. The final scores and weightings were fixed in Workshop 2 with EWA staff. In this analysis, a weighted average score of 3 or less led a technology to be eliminated from further consideration. The rationale behind the scoring for each technology area is described in this section.

## 3.2 Criteria Descriptions and Weightings

Alternatives that passed the fatal flaw filter were further evaluated and ranked based on both economic and non-economic screening criteria. The BC team worked with EWA staff to develop a series of evaluation criteria that reflect the project goals, EWA's values, and EWA's general operational practices. Criteria weights were assigned in Workshop 2 with EWA staff. Criteria and weightings are presented in Table 3-1.

	Table 3-1. Criteria and Weight for To		
Criterion	Description	Scoring Description	Weight
Proven Technology Performance	Proven and reliable technology with same configuration intended at Encina.  Long successful operating track record.	Low score indicates no successful large-scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.  High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration greater than 5 years, and vendors in Western U. S.	20%
Minimize Life-Cycle Costs	Qualitative metric of program cost.  Capital and O&M costs based on existing EWA data or similar experience at other WWTPs.	Low score indicates high capital cost to build onsite facilities and high 0&M costs.  High score indicates low capital cost to build onsite facilities and low 0&M costs.	10%
Energy/Resource Recovery	Increases biogas production through advanced digestion. Supports co-digestion of organic waste. Recovery of renewable energy.	Low score indicates high energy requirement for on-site technology, no increase in biogas production, technology does not recover energy as biogas, no recovery of renewable energy in biosolids, and no biosolids resource recovery.  High score indicates a higher biogas production, compatible with co-digestion of organic waste, and biosolids resource recovery.	25%
O&M Impacts	Impacts to existing plant 0&M staff levels. Complexity of new technology 0&M and control systems. Reliability of new technology (potential downtime). Minimal impacts to plant safety.	Low score indicates more O&M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and new chemicals or hazards.  High score indicates reduction in O&M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new chemicals or hazards.	10%
Environmental Impacts Impacts to carbon footprint and air permitting.		Low score indicates high carbon footprint for technology, and new permitting for environmental regulatory requirements.  High score indicates low carbon footprint for technology and no additional permitting for environmental regulatory requirements.	15%
Community and Stakeholder Impacts	Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.  Assess impacts to partner agency issues/values as well as local planning codes and requirements.	Low score indicates nuisance factors for on-site technology are difficult to mitigate.  High score indicates nuisance factors can be mitigated at plant site.	10%
Project Site Compatibility	Assess compatibility of technology with available plant footprint. Incorporation into existing treatment process.		10%

<sup>1</sup> Criteria are scored on a scale of 1-5, with 5 being the highest.

O&M = operations and maintenance

#### 3.3 Results and Discussion

Table 3-2 shows the scoring results for the waste heat utilization technologies that passed the fatal flaw filter. Use of waste heat for advanced digestion technologies received a higher score in every rating criteria over small-scale steam turbines. Rationale behind the scoring for each alternative is described below.

Thermophilic digestion is a proven process that could increase the plant's capacity to accept high strength waste. Because the additional heat demands can be satisfied by the existing cogeneration system, this specific use of waste heat minimizes life-cycle costs by generating tipping fee revenue and increasing DG production with few negative impacts.

THP in conjunction with mesophilic digestion can produce a Class A biosolids product, but requires steam to bring the inlet sludge up to high process temperatures. Waste heat from the cogeneration process can help offset this heat demand.

Small-scale steam turbines are an emerging technology. Newer versions of this equipment are more efficient than historical models, which makes the technology cost effective in place of traditional pressure regulating valves. The small-scale steam turbine may be most effective if combined with a THP system because both require steam.

Utilizing engine waste heat for either thermophilic digestion or THP is an established practice at several large WWTPs in the U.S. The process for thermophilic digestion is similar in concept to mesophilic digestion, with a hot water loop and heat exchangers. At the DC Water plant, heat is recovered in the form of steam to satisfy the high-quality heat demand of THP.

Recovering additional heat for use in thermophilic digestion does not have a significant capital cost, nor does it add a major O&M burden. Because EWPCF does not have an existing steam heat system, recovering heat for THP requires significant capital investment to install equipment for generating steam for and delivering steam to the THP system. In comparison, the cost to install a small-scale steam turbine relative to the increased power production has a higher cost to benefit ratio.

An air permit is required for both THP and small-scale steam turbines because a new boiler is required to produce steam. Air permitting requirements for boilers are presented in TM 6.

Table 3-2. Waste Heat Technologies Evaluation				
Criterion	Small-Scale Steam Turbines	Thermophilic Digestion/THP		
Proven Technology Performance	2	5		
Minimize Life-Cycle Costs	3	5		
Energy/Resource Recovery	4	4		
O&M Impacts	3	3		
Environmental Impacts	3	4		
Community and Stakeholder Impacts	3	4		
Project Site Compatibility	3	4		
Weighted Score	3.05	4.20		

## **Section 4: Conclusions and Next Steps**

Screening of heat utilization alternatives resulted in a final selection of technologies to be included in end-to-end alternatives and are summarized in the list below. These technologies will be combined with the results of Tasks 2, 3, and 4 for the creation of end-to-end alternatives for analysis in the SWEET model. Factors influencing solids stabilization will be paired with the heat utilization technologies, if applicable, to aid in selection of the best overall alternative. Development of end-to-end alternatives will be performed in cooperation with EWA staff prior to analysis. The shortlist of alternatives to be carried forward in SWEET analysis consists of small-scale steam turbines, in conjunction with THP, and providing heat to thermophilic digestion or THP.

Workshop #2 Presentation Slides

#### **Decisions**

The following is a list of decisions made as a result of the meeting discussion:

- BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.
- Stabilization technologies that moved to the next round of evaluation: Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.
- Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Presses.
- Post-dewatering technology that moved to the next round of evaluation: Thermal Drying -High Quality (Drum Dryer).
- Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines with Gas Conditioning, Internal Combustion Engines with Exhaust Treatment, Digester Upgrading Pipeline Injection, Micro-Turbines, Biosolids Drying Direct Use of Biogas, Large Scale Photovoltaics (PV), Small Scale Rooftop PV.
- Waste heat technologies that moved to the next round of evaluation: Small-Scale Steam Turbines, and Thermo/THP.

#### **Action Required**

The following is a list of actions required as a result of the meeting discussion:

- Jimmy to send Adam maintenance schedule costs.
- Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.
- Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments.
- Octavio to send EWA's SDG&E point of contact to Adam. EWA and BC to discuss initial contact with SDG&E regarding biomethane pipeline injection.
- Octavio to send Hari lab data on the performance of the centrifuges.
- Tom to work with Octavio on refining the solids mass balance.
- Adam to present a big picture view of the power production alternatives at the next workshop.
- BC to identify technologies that would be beneficial to visit at WEFTEC.
- BC will set up a meeting with Anaergia to discuss project goals and opportunities. This meeting will be separate from the Waste Hauler meeting.
- Scott L and Scott M will schedule Workshop 3 for mid-September aim for conducting the Waste Hauler meeting on the same day.
- EWA will take the dryer out of service in September/October. BC requests that any condition assessment results be shared with the team particularly related to the increased use of digester gas (siloxane or hydrogen sulfide issues).
- BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

#### **Summary**

Workshop #2 was held for the Encina Water Authority (EWA) Energy & Emissions Strategic Plan & Biosolids Management Plan Update. The purpose of this Workshop was to review pending administrative tasks and provide task updates. A summary of the discussion is provided below:

#### Introductory Items

BC started off the meeting by reviewing the schedule and goals for the meeting. The goals are to generate content and direction for the project team moving forward.

- This month, the Brown and Caldwell (BC) team will be:
  - Preparing a baseline report, to be reviewed by EWA in September.
  - o BC will also be preparing report sections of Tasks 2 and 3 by September.
  - In October and November, BC will be developing SWEET alternatives and providing more clarity on how the pieces interact.
- Adam Ross (Adam) stated that he expects to have more questions about permitting, cogeneration (cogen), electrical rates, and where to send digester gas, and would appreciate dialogue between now and the next workshop. EWA staff recommended for him to work with Octavio Navarrete (Octavio).

#### **New Data Request Items**

BC reviewed new data request items with EWA. They included:

• Trussell food waste capacity report - Scott McClelland (Scott M) stated that he has the data, but not the report, on the Trussell study. Preliminary conclusions of the report indicate that EWA could accept an additional 80,000 gal/week of FOG and 25,000 gal/week of brewery waste. EWA expect it'll take about another month before the report is ready. Imported wastes are received Monday – Friday/Saturday. A constant feed to the digesters is provided until around Saturday afternoon. A potential limitation to high strength waste acceptance is truck offloading capacity. A food waste pilot program began on Monday, 9/14.

- O&M costs for cogen engines Adam asks if EWA has annual O&M costs for the engines. Jimmy Kearns (Jimmy) states that EWA has annual costs for the maintenance schedule.
  - ACTION: Jimmy to send Adam maintenance schedule costs.
- WAS flow data
  - BC requests the WAS flow data, and Octavio indicates that EWA does have that data.
  - o ACTION: Octavio to send WAS daily flow data to Hari Seshan (Hari).
- Air permitting summaries or progress
  - o Doug Campbell (Doug) sent Adam the latest email from Don King (Don).

#### **Outstanding Data Requests**

BC reviewed outstanding data requests with EWA. They included:

- Cogen drawing and cut-sheets
  - o Natalie Sierra (Natalie) points out that BC has received drawings from Andritz.
- Information on energy management
- High strength waste storage (typical day operating procedure)
- ACTION: Scott L to send list of additional data/document requests over to Scott M after updating based on discussion.

There was a subsequent discussion on wasted gas that was being flared. Octavio explains that the operators need to manually control the digester gas flow to the dryer, which results in some flaring. Operators generally try to set the digester gas flow rate to avoid drawing down the gas system and triggering natural gas blending at cogen. This typically results in a conservative offtake of digester gas to the dryer which results in some flaring. Mike Steinlicht (Mike) asks how much is being flared, and Adam calculated that about 180 kW of gas was being flared (averaged over a month) in current operation.

Cogeneration operation was discussed. EWA operates two engines on digester gas 24/7. A third engine operates on natural gas during peak power rates. EWA physically disconnects from the power grid to avoid demand and consumption charges.

FOG is fed to the digesters at a constant rate of 12 gallons per minute. FOG is fed to only one or two digesters, not all. The FOG feeding begins on Monday with first deliveries of the week, and continues into Saturday to pump down material from the last deliveries on Friday.

#### **Meeting with Waste Haulers**

BC reviewed the timing, attendees, and goals of the Waste Haulers Meeting. Below is a summary of the discussion:

- Scott L reviewed the potential list of attendees, which included: EWA representatives, BC representatives, Waste Management (WM), Republic, EDCO, and potentially LES or Anaergia.
  - ACTION: Scott M to send a list of EWA attendees for the Waste Haulers Meeting to BC.
- Scott M stated that the intent of the meeting is to develop a public-private partnership and noted increase grant eligibility by having this kind of relationship.
- Mike emphasized that the elected officials want all of the waste haulers at the table, especially those that operate within EWA's service area.
- Adam reviewed the draft Waste Hauler Agenda, which would cover background on the plant, current operation, and a discussion of potential capacity.
- Scott M stated that he would like to have an agenda finalized and sent out to each waste hauler 30 days in advance of the meeting, to give them adequate prep time.
  - ACTION: Adam to send a draft agenda of the Waste Haulers meeting to EWA and finalize per any EWA comments 30-days in advance of the meeting.
- Adam stated that another discussion point for the meeting is the waste haulers potential interest in accepting compressed natural gas (CNG). Scott M stated that SDG&E should be involved in these conversations as well. A meeting should be arranged with SDG&E.
  - o ACTION: Octavio to send EWA's SDG&E point of contact to Adam.
- Different gas delivery options, tube trailer vs. pipeline, were discussed. Adam stated that a
  tube trailer has less stringent standards than a pipeline, but there would be tube trucks coming in and out of the facility. However, the pipeline would have more stringent sampling/reporting requirements and the investment for an interconnection for the pipeline could cost
  \$1 2 million dollars. This will be developed as the alternatives analysis is advanced.

#### Other Outstanding Items

BC reviewed their understanding of the discussion with Anaergia:

Adam stated that Anaergia is promoting Omnivore as a process treatment option, which may
or may not be the right fit at EWA. However, there might be opportunity for Anaergia to work
with waste haulers for pre-processing food waste.

#### Review of Mass Balance and Project Flows and Loads

BC presented the project flows and loads:

- Mass Balance
  - Hari reviewed the assumptions made to calculated WAS. Octavio responded that the actual WAS flow is around 0.75 MGD, and that he could send that data to BC (ACTION above).
  - Adam stated that the VSR value of 65% seemed suspiciously high. Octavio stated that EWA's VSR value was closer to 55%.
  - Hari stated that the centrifuge % capture right now is 78%. Octavio responded that
    the capture rate for the centrifuges is consistently 95%, and that the calculated value
    is probably lower because of values during start-up and shut-down.
    - ACTION: Octavio to send Hari lab data on the performance of the centrifuges.

o Tom requested that the BC team review the data with Octavio after he send is to BC.

- ACTION: Tom to send up conference call with Octavio after reviewing the data.
- Solids Mass Balance Comparison
  - Tom presented a graph that shows that BC's calculated solids loading was higher than the calculated values in the Process Master Plan (2016).
  - Octavio stated that one reason for the increase might be a 2015 change in how EWA sampled the influent flow.
  - o ACTION: Tom to work with Octavio on refining the solids mass balance.
- Power Loads and Gas Usage
  - Adam reviewed the gas usage graphs with EWA.
  - Digester Gas Usage Summary Total gas production is trending up, probably due to the increase in high strength waste deliveries. Adam pointed out that the yellow "Total Gas Production" line didn't match up with the top of the bars, which is normal. Scott M pointed out that the important part is that the yellow line followed the same trend as the bars.
  - Natural Gas Usage Summary Most of the natural gas is being used for the heat dryer and cogen, which is expected.
  - Power Production and Import Currently, EWA is making about 80% of their electricity needs. This means that EWA could potentially export power. A look into the SDG&E power bills also showed that the actual kWh power that EWA is purchasing only constitutes \$10,000 out of a \$70,000 bill. The majority of the bill is non-coincident and standby power.
    - Mike stated that he had talked to SDG&E about the standby charges and haven't been able to get around them.
- Engine Fuel Use
  - Octavio explained that the increase in natural gas in November 2015 was because they needed to switch to natural gas to stay below emission limits.

#### Screening of Technologies

BC the fatal flaw filter and evaluation criteria, and then evaluated each process technology against that criteria. The results of the evaluation are summarized below and more details are included in the attached Workshop #2 PowerPoint slides.

- There were four fatal flaw filters:
  - o At least one successful North American installation of the technology
  - At least one successful installation in a facility of similar size
  - There is available space to implement that technology
  - Compatibility with plant size and any existing equipment
- The technologies that passed the fatal flaw filter were then scored for each evaluation criteria, which included: end use market compatibility, proven technology performance, life cycle costs, energy/resource recovery, O&M impacts, environmental impacts, community and stakeholder impacts, and project site combability.
  - Each evaluation criteria was then weighted to reflect EWA's priorities.

 Technologies that scored lower than a 3 were eliminated, and technologies that scored greater than a 3 would be evaluated through the SWEET model.

O&M impacts criteria will be clarified to describe reduction in O&M staff time.

#### Thickening Technologies

- Prior planning efforts recommended evaluating rotary drum thickeners (RDTs)
  against the existing primary clarifier and dissolved air flotation thickeners (DAFTs).
  EWA concurred with that recommendation.
- Natalie asked if the team should add Anaergia's Omnivore to the list of technologies to evaluate. Scott L proposed that that decision to be made after a meeting with Anaergia takes place.
  - DECISION: BC team to evaluate RDTs against the current status quo of primary clarifier and DAFT.

#### Stabilization Technologies

- Technologies that failed the fatal filter: Staged Digestion, Acid/Gas Phased Digestion, Temperature Phased Anaerobic Digesion, Enzymatic Hydrolysis, Chemical Hydrolysis, THP – DLD. and Solid Stream CAMBI.
- o Technologies that scored lower than a 3 in the evaluation criteria: Lystek.
- (DECISION) Stabilization technologies that moved to the next round of evaluation:
   Mesophilic Digestion, Mesophilic Digestion with High Solids, Thermophilic Digestion, and Traditional CAMBI.

#### Dewatering Technologies

- o Technologies that failed the fatal filter: Bucher Press.
- Technologies that scored lower than a 3 in the evaluation criteria: Screw Press, Rotary Press, and Volute Press.
- (DECISION) Dewatering technologies that moved to the next round of evaluation: Centrifuges and Belt Press.
- Post-Dewatering Technologies
  - Technologies that failed the fatal filter: Thermal Drying: Low Quality (Indirect Dryer),
     Gasification, and Pyrolysis.
  - o Technologies that scored lower than a 3 in the evaluation criteria: N/A
  - (DECISION) Post-dewatering technologies that moved to the next round of evaluation:
     Thermal Drying: High Quality (Drum Dryer).
- Alternative Power Production Technologies
  - Technologies that failed the fatal filter: Fuel Cells and Wind Turbines.
  - Technologies that scored lower than a 3 in the evaluation criteria: Energy Storage (Batteries), Large Scale Solar Photovoltaics
  - (DECISION) Alternative power production technologies that moved to the next round of evaluation: Internal Combustion Engines (Status Quo), Internal Combustion Engines – with Gas Conditioning, Internal Combustion Engines – with Exhaust Treatment, Digester Upgrading – Pipeline Injection, Micro-Turbines, Biosolids Drying – Direct Use of Biogas, Large-Scale Solar Photovoltaics (PV), and Small Scale Rooftop PV.
- Waste Heat Technologies
  - Technologies that failed the fatal filter: Absorption and Adsorption Chillers, Organic Rankine Cycle, and Gasification of Biosolids.

- Technologies that scored lower than a 3 in the evaluation criteria: N/A
- (DECISION) Waste heat technologies that moved to the next round of evaluation:
   Small-Scale Steam Turbines, and Thermo/THP.

#### Creation of End to End Alternatives

The BC team reviewed initial alternatives that were to be evaluated, as well as different power production alternatives. The power production alternatives included:

- · Baseline: existing cogen and drying
- · Baseline with gas conditioning
- Existing cogen with vehicle fuel (via pipeline injection or tube trailer)
- Existing cogen with microtubines
- Existing cogen with steam boiler/turbine
- New cogen permit, CO catalyst and selective catalytic reduction (SCR), with gas conditioning
- · Vehicle fuel (primary use of digestive gas) with existing cogen
- ACTION: Adam to present a big picture view of the power production alternatives at the next workshop.

#### **Grant Updates**

BC provided an overview of different grant programs, and explained how the program would fit into the SWEET model. The programs included:

- Self-Generation Incentives Program
- Low Carbon Fuel Standard
- Renewable Fuel Standard
- Organics Grant Program
- · Healthy Soils Program
- Green Project Reserve

#### **Air Permitting Discussion**

BC and EWA discussed the current efforts of the air permit modification. EWA is submitting a request for permit modification in one week. If successful, it would increase the permitted cogen capacity by  $\sim 20\%$ .

#### Look Ahead & Wrap-Up

The meeting ended with a look ahead and reviewing pending action items.

- Workshop #3 will take place in mid-September, and the team will try to schedule the Waste Hauler Meeting on the same day.
- The team will present the following in Workshop #3:
  - o Baseline SWEET model
  - o Conceptual layouts and details of alternatives for consensus and feedback
  - Air permitting impacts on power production alternatives
  - Grant updates
- WEFTEC is also taking place in early-October. Mike stated that it would be beneficial to walk the floor together with BC to look at potential technologies.
  - ACTION: BC to identify technologies that would be beneficial to visit at WEFTEC.

• ACTION: BC to check in with EWA to confirm is any support is needed related to the next board meeting on Oct 11.

**Energy & Emissions Strategic Plan & Biosolids Management Plan Update** 

# Workshop #2 – August 16, 2017

**Encina Water Pollution Control Facility** 

# **Project Schedule**

- Progress On Schedule
- Task 1 Energy Baseline Complete
- Strategic Plan & Strategic Plan Update Other Tasks (except 7) are Under Way
- Workshop #2 Today

# Agenda

- Administrative (20 min)
  - Status of data requests
  - Comments on waste hauler agenda
  - Discussion with Anaergia
- Review Mass Balance and Projected Flows and Loads (45 min)
- Review Fatal Flaw and Screening Criteria (30 min)
- Screen Technologies (1 hr)
- Discussion of Preliminary End to End Alternatives (30 minutes)
- Grants Update (10 min)
- Air Emissions Review (5 min)
- Wrap-Up/Review Action Items (10 min)

# **New Data Requests**

- Trussell food waste capacity report
- O+M costs for the engines (have costs for electricity for the system, but not for gas treatment, upkeep, general maintenance, etc.)
- WAS daily flow data (back-calculated for mass balance)
- FOG TS and VS data (used assumptions from 2016 PMP for mass balance)
- Any air permitting summaries or progress between EWA and Don King

# **Outstanding Data Requests**

- Cogen and solids systems drawings, engine cut sheets
- Dryer system drawings and cut sheets
- Recent air permitting efforts progress, memos, contact info
- Copies of current air permits (SDAPCD and Title V)
- Energy Management typical day operating procedure:
  - Cogen strategy
  - Peak period disconnect from utility
  - HSW storage and feed strategy

# Waste Hauler Agenda

- Timing: September (coordinate with Workshop 3)
- Attendees:
  - EWA Scott, Jimmy
  - BC Adam, Ari
  - WM
  - Republic
  - EDCO
  - LES?
  - Anaergia?
- Goals:
  - Provide background info to haulers about EWA's goals and BEE effort
  - Determine availability of pre-processed food waste, market demand for an EWA initiative to receive more material, tipping fee range for SWEET analysis
  - Gauge interest in a renewable CNG partnership
  - Discuss "next steps" such as letter of intent, future coordination

# Other Outstanding Items

- Discussion with Anaergia
  - Omnivore as an alternative
  - Orex or Biorex for food waste pre-processing
  - and Caldwell Brown and Caldwell Prepared by Brown Status of food waste receiving project(s) with Republic
  - Capacity at Rialto facility for dried product?

# Review of Mass Balance and Projected Flows and Loads

# **Mass Balance**

#### **MAY 2015 - JUNE 2017**

9

# **Mass Balance Assumptions**

- TWAS flows that were zero and subsequent loads when TWAS flow was zero were excluded. Assumed percent capture rate for the DAFTs is 95%.
- TWAS flows were taken from DAFT totalizer data and digester feed meters.
- The digester feed flow from July 1, 2016 to June 2017 were subtracted daily to obtain a daily digester feed volume. This was based on the assumption that the flow values were cumulative from a meter reading starting 7/1/16.
- The Class B cake data were averaged with zero data to obtain an annualized daily average.
- FOG data were a daily average of the volumes received. This assumes FOG is fed 24/7/365. Assumes %TS and %VS are 5% and 82%, respectively.
- To calibrate the mass balance as shown, 2,300 lbs TS/d and 1,900 lbs VS/d were added to Primary Sludge.

# **Solids Mass Balance Comparison**

# Sludge Production Peaking Factors

	Max Month	Peak 2-Week	Peak Week	Peak Day
Primary Sludge	1.23	1.3	1.4	1.60
WAS	1.23	1.3	1.4	1.60
Combined Sludge	1.23	1.3	1.4	1.60

#### Notes:

- Peaking factors for maximum month and peak day conditions are developed based on 2016 PMP solids projections.
- Peaking factors for maximum 2-week and maximum week conditions are proposed based on historical data.

# **Power Loads and Gas Usage**

- Power:
  - Monthly production: 1,500 kW (2, 750 kW engines full output)
    - 80% of total electrical demand)
  - Monthly import: 385 kW equivalent (1,390 MWh per year)
- Digester gas:
  - Average production: 1,645,000 therms per year Caldwell
  - Engines: 1,263,000 therms per year
  - Waste gas: 229,000 therms per year
  - Heat dryer: 57,000 therms per year
- Natural gas: 856,000 therms per year
  - Engines: 156,000 therms/year
  - Other plant use: 700,000 therms/year

#### Digester Gas Usage Summary - Last 2 years

- 1) What happened November 2015? DG outage?
- 2) Divergence of "total gas production" from sum of other meters
- 3) When DG is sent to the heat dryer, what contributes to flaring?
- 4) Flared gas, over the course of the last year, represents 179 kW of "potential" power production

#### Natural Gas Usage Summary – Last 2 years

1) What is the NG control strategy to cogen? Why is there NG contribution to cogen in months where DG is being sent to dryer or flare?

#### Power Production and Import – Last 2 years

- 1) Consistently operating at 2-engine output
- 2) Operating a third engine at full output (if DG production increases and/or permit is modified) would result in power export

#### **Engine Fuel Use-Last 2 years**

- 1) Consistent operation
- 2) What is NG blending strategy?

## **Screening of Technologies**

#### **Fatal Flaw Filter**

- Applied uniformly across all technologies
- Four criteria:
  - At least one successful North American installation of technology
  - At least one successful installation in a facility of similar size
  - Available space
  - Compatibility with plant size and any existing equipment

#### **Evaluation Criteria**

Criterion	Criterion Description	Scoring Description
End Use Market Compatibility	<ul> <li>Onsite technology directly produces one of the recommended product alternatives.</li> <li>Alternately, onsite technology product is compatible with product alternatives.</li> </ul>	<ul> <li>Low score indicates technology product that has not been identified as part of the product list nor compatible with the product list.</li> <li>High score indicates technology product that is compatible with Class B cake, Class A cake, Class A THP cake, and dried Class A pellet.</li> </ul>
Proven Technology Performance	<ul> <li>Proven and reliable technology with same configuration intended at Encina.</li> <li>Long successful operating track record.</li> </ul>	<ul> <li>Low score indicates no successful large scale operating installations in North America or Europe, no successful demonstration scale installations in North America or Europe, and unknown safety or reliability record.</li> <li>High score indicates more than one successful operating installation in North America or Europe, more than one operating installation at a WWTP of at least 40 mgd in North America or Europe, track record duration &gt; 5 years, and vendors in Western USA.</li> </ul>
Minimize Life Cycle Costs	<ul> <li>Qualitative metric of program cost.</li> <li>Capital and O&amp;M costs based on existing Encina data or similar experience at other WWTPs.</li> <li>Potential revenues from sales.</li> <li>Product/market geographic proximity.</li> </ul>	<ul> <li>Low score indicates high capital cost to build onsite facilities, high O&amp;M costs, expensive end use market, and high transportation costs.</li> <li>High score indicates low capital cost to build onsite facilities, low O&amp;M costs, potential product revenue, and product destination within 100 miles.</li> </ul>

#### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Energy/Resource Recovery	<ul> <li>Increases biogas production through advanced digestion.</li> <li>Supports co-digestion of organic waste.</li> <li>Recovery of renewable energy.</li> <li>Beneficial use of biosolids product.</li> </ul>	<ul> <li>Low score indicates high energy requirement for onsite technology, no increase in biogas production, technology does not recover energy as biogas, no recovery of renewable energy in biosolids, and no biosolids resource recovery.</li> <li>High score indicates a higher biogas production, compatible with co-digestion of organic waste, and biosolids resource recovery.</li> </ul>
O&M Impacts	<ul> <li>Impacts to existing plant O&amp;M staff levels.</li> <li>Complexity of new technology O&amp;M and control systems.</li> <li>Reliability of new technology (potential downtime).</li> <li>Minimal impacts to plant safety.</li> </ul>	<ul> <li>Low score indicates more O&amp;M time required, complex mechanical and control systems required compared with existing plant facilities, potential equipment downtime, and new chemicals or hazards.</li> <li>High score indicates reduction in O&amp;M staff time required, new technology is simple to operate and maintain, reliable with minimal downtime, and no new chemicals or hazards.</li> </ul>
	Minimal impacts to plant safety.	

### **Evaluation Criteria (cont.)**

Criterion	Criterion Description	Scoring Description
Environmental Impacts	Impacts to carbon footprint and air permitting.	<ul> <li>Low score indicates high carbon footprint for technology, high travel distance to end use, difficult to treat side-streams or impacts to GWRS, and new permitting for environmental regulatory requirements.</li> <li>High score indicates low carbon footprint for technology, low travel distance to end use, minimal side-stream generation or impacts, no additional permitting for environmental regulatory requirements.</li> </ul>
Community & Stakeholder	<ul> <li>Minimize nuisance impacts such as dust, odors, vectors, aesthetics, noise and traffic.</li> <li>Assess impacts to partner agency issues/values as well as local planning codes and requirements.</li> </ul>	<ul> <li>Low score indicates nuisance factors for onsite technology are difficult to mitigate.</li> <li>High score indicates nuisance factors can be mitigated at plant site.</li> </ul>
Project Site Compatibility	<ul> <li>Assess compatibility of technology with available plant footprint.</li> <li>Incorporation into existing treatment process.</li> <li>Ability to accept co-digestion substrates.</li> </ul>	<ul> <li>Low score indicates lack of site space for new facilities, requires abandonment of existing facilities, and difficult integration with existing plant.</li> <li>High score indicates available footprint for new facilities and maintains space for future facilities, easy of integration with existing processes and facilities.</li> </ul>

#### **Evaluation Criteria Weighting**

Criterion	Weight Stabilization	Weight Dewatering	Weight Biogas Use and Waste Heat
End Use Market Compatibility	15%	15%	NA
Proven Technology Performance	15%	25%	20%
Minimize Life Cycle Costs	10%	20%	10%
Energy/Resource Recovery	20%	NA	25%
O&M Impacts	10%	15%	10%
Environmental Impacts	10%	5%	15%
Community & Stakeholder Impacts	10%	5%	10%

#### **Creation of End to End Alternatives**

#### **Evaluating Technologies and Markets Together**

#### **Initial Alternatives**

- Meso plus second dryer
- Meso plus Class B hauling
- Thermophilic
  - Prepared by Brown and Caldwell With and without second dryer
- Cambi (traditional)
  - With and without second dryer

- Additional Layers
  - Thickening
  - Dewatering
  - Energy alternatives

#### **Alternatives: Power Production**

- Baseline: Existing cogen + drying
- Baseline + gas conditioning
  - Gas conditioning serves to reduce O&M costs associated with engines and dryer
- Existing cogen + vehicle fuel (via pipeline injection or tube trailer)
  - No permit modification to cogen / no DG to dryer
  - Continue to operate two engines
  - Additional gas routed to vehicle fuel
- Existing cogen + microturbines
  - Includes gas conditioning
  - No permit modification to cogen / no DG to dryer
- Existing cogen + steam boiler/turbine
  - No permit modification to cogen / no DG to dryer
  - Additional gas routed to steam boiler; steam used in small turbine
- New cogen permit, CO catalyst and SCR, gas conditioning
  - Need to consider plant demand as a limit on power production
- Vehicle Fuel (primary use of DG) + existing cogen (natural gas + tail gas)

"All in" on vehicle fuel

# Baseline includes cogeneration (permit limited), dryer and some flaring

#### Gas conditioning could reduce engine and dryer O&M costs associated with siloxanes

#### **Baseline with Gas Conditioning**

# With the existing permit in place, where else can we send digester gas to get highest value?

#### **Existing Cogen Options - No Permit Modification**

# A permit modification allows EWA to meet plant electricity demand, but any additional gas would need to go to a non-generating use

## An all-vehicle-fuel option may deliver the best economics

#### **Vehicle Fuel**

## Alternatives to be presented at next workshop

# **Grant Updates**

# **Self Generation Incentive Program**

Program	Self-Generation Incentive Program (SGIP)
Agency	California Energy Commission / administered by SDG&E
Eligible Projects	Self-generation projects such as new engines, microturbines, or steam turbines – increased incentives for renewable/biogas projects; Energy storage / batteries
Funding	Incentives based on anticipated power output – based on fuel availability, not nameplate capacity; 50% paid upfront / 50% paid over 5 years based on performance
Schedule	Funding available each year / first-come, first-served Battery funding decreases as tiers fill up Projects must be operational within 18 months of award
How much are we talking?	~\$500k - \$1M depending on project size
Recommendation for SWEET Analysis	Don't count on funding to justify project economics
Next steps	Continue to track / pursue if selected alternatives meet criteria

## **Low-Carbon Fuel Standard**

Program	Low-Carbon Fuel Standard (LCFS)
Agency	California Air Resources Board
Eligible Projects	Part of AB 32 scoping plan – projects that reduce the carbon intensity of California's vehicle fuel – i.e. renewable compressed natural gas (CNG vehicle fuel)
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs
Schedule	Ongoing program, recently extended through 2030
How much are we talking?	Varies could equate to $\sim 0.50/DGE - 1.00/DGE$ depending on market factors
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2030, use conservative values
Next steps	Continue to track / pursue if vehicle fuel is recommended

## Renewable Fuel Standard

Program	Renewable Fuel Standard
Agency	US Environmental Protection Agency
Eligible Projects	Renewable fuel projects – i.e. renewable compressed natural gas (CNG vehicle fuel)
Funding	Incentives based on fuel production, market-based values; Paid on a per-gallon basis as the project performs
Schedule	Ongoing program, not guaranteed beyond 2022
How much are we talking?	A lot of uncertainty: Wastewater digester gas is eligible for highest value of RINs – D3 EPA has recently stated that DG from food waste is a lower value – D5 EPA has the ability to set RIN quotas, which drive supply-and-demand, market-based pricing
Recommendation for SWEET Analysis	Include in SWEET analysis for vehicle fuel projects; Assume funding only through 2022, use conservative values
Next steps	Continue to track / pursue if vehicle fuel is recommended

# **Organics Grant Program**

Program	Organics Grant Program
Agency	Department of Resource Recovery and Recycling (CalRecycle)
Eligible Projects	Projects that serve to divert organics (food waste) from landfill – toward anaerobic digestion or composting; recently issued with a food rescue requirement
Funding	Incentives based on project size and potential tons diverted
Schedule	Recently awarded, not expected to reissue for ~18 months
How much are we talking?	Up to \$4M per project
Recommendation for SWEET  Analysis	Do not include – too competitive to count on
Next steps	Continue to track / pursue if food waste receiving is recommended

# Organics Grant Program - Recent Award

#### Recommendation:

Staff recommends approval of 10 grant awards, as listed in Table 1 below, for \$24,000,000.

Table 1. Organics Grant Program Recommended Award – List A

Applicant	County	Total Award
Anaerobic Digestion Projects		
County Sanitation Districts of Los Angeles County	Los Angeles	\$4,000,000
HZIU Kompogas SLO, Inc.	San Luis Obispo	\$4,000,000
Rialto Bioenergy Facility, LLC	San Bernardino	\$4,000,000
	Subtotal	\$12,000,000
Compost Projects		
City of San Diego	San Diego	\$3,000,000
Mid Valley Recycling, LLC	Fresno	\$1,875,000
Salinas Valley Solid Waste Authority	Monterey	\$1,341,865
Recology Yuba-Sutter (partially funded)	Yuba	\$2,783,135
	Subtotal	\$9,000,000
Rural Compost Projects		
Napa Recycling & Waste Services, LLC	Napa	\$541,700
South Lake Refuse Company, LLC	Lake	\$1,218,026
West Coast Waste (partially funded)	Madera	\$1,240,274
	Subtotal	\$3,000,000
	Grand Total	\$24,000,000

# **Organics Grant Program - Recent Award**

Table 2. Organics Grant Program Recommended Award - List B

Applicant	County	Total Award Requested*		
Anaerobic Digestion Projects				
CR&R Incorporated	Riverside	\$4,000,000		
Contra Costa Waste Services	Contra Costa	\$4,000,000		
City of Manteca	San Joaquin	\$1,500,000		
Santa Barbara County	Santa Barbara	\$4,000,000		
Subtotal		\$13,500,000		
Compost	Projects			
Recology Yuba-Sutter (partially funded)	Yuba	\$216,865		
Agromin OC, LLC	San Bernardino	\$600,000		
Waste Management of Alameda County, Inc.	Alameda	\$3,000,000		
GreenWaste Recovery, Inc.	Santa Clara	\$1,700,000		
Burrtec Waste Industries, Inc.	Riverside	\$3,000,000		
Arakelian Enterprises Inc. DBA Athens Services	San Bernardino	\$3,000,000		
Best Way Disposal Company, Inc. DBA Advance Disposal Co.	San Bernardino	\$2,481,250		
Kern County	Kern	\$3,000,000		
City of Oceanside	San Diego	\$1,178,351		
Subtotal		\$18,176,466		
Rural Comp	ost Projects			
West Coast Waste (partially funded)	Madera	\$161,326		
Upper Valley Disposal Service	Napa	\$1,250,000		
Subtotal		\$1,411,326		
	Grand Total	\$33,087,792		

# **Heathy Soils Program**

Program	Healthy Soils Program
Agency	California Department of Food and Agriculture
Eligible Projects	Demonstration projects that sequester carbon and reduce GHG emissions – groups within CASA
Funding	Incentives based on project size and potential GHG benefit
Schedule	Currently accepting applications through September 19 Annual funding program (AB 32 funds), amounts and criteria may vary
How much are we talking?	Up to \$3.75M total
Recommendation for SWEET Analysis	Do not include / ancillary benefit to support end use program
Next steps	Continue to track / connect with CASA Science and Research Group for potential partnerships

# **Green Project Reserve**

Program	Green Project Reserve
Agency	California Water Resources Control Board
Eligible Projects	Projects that improve energy efficiency, renewable energy generation, or recycled water production
Funding	A component of Clean Water State Revolving Funding; Green Project Reserve is a "loan forgiveness" program CWSRF is generally oversubscribed, but GPR is underutilized
Schedule	Ongoing
How much are we talking?	Up to \$4M per project, or 50% of project value, whichever is higher
Recommendation for SWEET Analysis	Do not include
Next steps	Something for EWA to keep in mind – if a larger capital project requires funding, consider CWSRF and adding an eligible GPR component

# **Air Permitting Discussion**

## EWA is actively pursuing air permit modification

- EWA (with Don King) will submit a request for permit modification within ~1 week
- Goal is to adjust the CO emission rate from 530 ppm to ~400 ppm, and thereby adjust the fuel input limit aimed at keeping CO emissions below Title V synthetic minor threshold
- If successful, this effort would increase permitted cogen capacity by ~20%
- This increase would allow EWA to meet plant electricity demand with current digester gas flows and cogen system

# Look Ahead & Wrap-Up

# **Project Schedule**

- Workshop #3 in mid-September
- Draft Analysis and Reports to Begin

## **Look Ahead – September Workshop**

- Consensus on mass balance/baseline
- Conceptual layouts/details of alternatives for consensus/feedback (example numbers to support including biogas production, food waste that can be imported)
- Air permitting impacts on power production alternatives
- Informational meeting with waste haulers
- Debrief on Anaergia meeting
- Grants update

### **Executive Summary**

The Encina Water Pollution Control Facility (EWPCF) currently has four 750-kilowatt (kW) internal combustion (IC) engines, a biosolids dryer, a waste gas flare, and a wet scrubber and regenerative thermal oxidizer. Operation of and air emissions from these technologies are currently regulated by the San Diego Air Pollution Control District. Changes to biosolids processing, energy production and utilization, and waste heat recovery that are covered in Technical Memoranda (TMs) 2, 3, 4, and 5 may require modifications to the existing air permits or new air permits. Specific regulatory requirements for alternatives that produce emissions and pass fatal-flaw filters in TMs 2, 3, 4, and 5 are discussed in this TM 6. Alternatives that may require permitting changes include:

- Changes to thermal drying operation
- Changes to internal combustion engine operation
- Addition of microturbines for power generation
- Addition of boilers to provide steam for a Cambi<sup>TM</sup> thermal hydrolysis process
- Changes to odor control equipment associated with new odor sources
- Addition of digester gas conditioning
- Addition of digester gas upgrading for pipeline injection or vehicle fuel
- Addition of digester gas storage

New regulations and regulatory trends that may impact future air permitting for EWPCF were also assessed as part of this TM.

Last, a greenhouse gas (GHG) inventory was performed for the existing gas utilization technologies, including the engines, thermal biosolids dryer, RTO, and flare. Potential GHG reductions associated with future energy production alternatives are included in the discussion of the GHG inventory.

### **Section 1: Introduction**

EWA has undertaken a Biosolids Energy and Emissions Plan (BEE Plan) which will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- 1. Provide a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat;
- 2. Address capacity limitations in the solids handling process at the EWPCF;
- 3. Assess which alternative is likely to be the most cost effective and sustainable solution for EWA;
- 4. Move the EWPCF toward greater energy independence; and
- 5. Reduce greenhouse gas emissions.

The purpose of TM 6 is to review permit requirements related to air emissions associated with the cogeneration operation. This TM explores opportunities to remove the air permit constraints to optimize the use of the existing IC engines, presents pathways to meet Best Available Control Technology (BACT) and other air emission requirements for potential alternatives in TMs 3, 4 and 5, and presents the greenhouse gas inventory (GHG) for the existing operation that future alternatives can be measured against.

#### 1.1 Existing SDAPCD Permit

The EWPCF is regulated under the San Diego County Air Pollution Control District (SDAPCD). SDAPCD permits establish operating limits based on maximum estimated emissions levels that must be confirmed by regular source testing. Regulated processes at the plant include stationary sources and abatement devices. Emissions requirements differ between stationary sources and abatement devices. Major stationary sources at the plant are:

- One Andritz DDS40 biosolids dryer
- Four Caterpillar G3516 750-kW lean-burn internal combustion (IC) engines

Abatement devices at the plant are:

- One Varec Biogas 244 Series enclosed flare
- One wet scrubber and one CECO Systems regenerative thermal oxidizer (RTO), which are coupled with the biosolids dryer

The air permits for the four IC engines limit fuel consumption and emission of criteria air pollutants. EWA pursued air permit modifications for the IC engines to increase the permitted fuel consumption. An updated IC engine air permit was received on November 8, 2017 (Attachment A). Fuel consumption and emission limits for the IC engines from the previous permit and the new permit are summarized in Table 1-1. The IC engine air permits also delineate source testing, maintenance, record-keeping, and site accessibility requirements.

Table 1-1. Previous and Existing Air Permit Requirements for the IC Engines			
Requirement	Previous Permit Limit	New Permit Limit	Units
Nitrogen oxides (NO <sub>x</sub> ) emissions limit, digester gas	47	47	Parts per million by volume (ppmv)
NO <sub>x</sub> emissions limit, natural gas	54	54	ppmv
Carbon monoxide (CO) emissions limit, digester gas	569	400	ppmv
CO emissions limit, natural gas	390	390	ppmv
Annual fuel consumption, total	224,000,000	280,000,000	Standard cubic feet (scf)
Annual fuel consumption, natural gas	22,400,000	28,000,000	scf
Daily fuel consumption, digester gas	1,000,000	1,000,000	scf
Daily fuel consumption, natural gas	550,000	550,000	scf

Note: Fuel consumption limits include all four engines.

No modifications to the air permits for the biosolids dryer, flare, and wet scrubber and RTO have been requested, but EWA may need to pursue an updated flare permit to meet projected digester gas production. The potential for a new flare permit is discussed further in Section 2.5. The current flare permit allows digester gas usage of 300 million scf/year, which equates to approximately 570 scf/minute. Flare operation, maintenance, and monitoring requirements are also defined in the permit.

#### 1.2 Synthetic Minor Facility

EWPCF currently operates as a Synthetic Minor Facility, meaning the facility's stationary emissions sources have the potential to exceed at least one of the Title V Major Source thresholds. For reference, the Major Source thresholds are provided in Table 1-2. Stationary emission sources at EWPCF are operated to keep the facility within the Synthetic Minor Facility confines. Historically, CO has been the limiting air pollutant (i.e. CO emissions have been closest to the applicable Major Source threshold). IC engine operation produces most of the CO emissions.

Table 1-2. Title V Major Source Emissions Thresholds		
Pollutant	Emissions Threshold (tons/year)	
Volatile organic compounds (VOCs)	100	
Inhalable particulates (PM10)	100	
Sulfur dioxide (SO <sub>2</sub> )	100	
NO <sub>x</sub>	100	
CO	100	
Ozone depleting compounds	100	
Lead compounds	10	
Single Hazardous Air Pollutant	10	
Combination of Hazardous Air Pollutants	25	

#### **Section 2: Future Alternatives**

All alternatives that involve future modifications or additions of equipment that may produce air emissions must be compliant with current SDAPCD. California Air Resources Board (CARB), and federal regulations.

First, considerations for EWPCF's Synthetic Minor status must be made when evaluating alternatives. Some alternatives, such as expanding IC engine operation or adding a second biosolids dryer, may cause annual emissions of one or more regulated pollutants to exceed the respective Major Source threshold. Because CO emissions at EWPCF have historically been close to this limit, additional CO emissions from future alternatives and CO emissions controls must be weighed when evaluating these alternatives. Exceeding any Major Source threshold would change EWPCF's status from a Synthetic Minor facility to a Title Major Source Facility. Obtaining a Title V permit involves significant costs and reporting requirements, and EWA has expressed a desire to maintain EWPCF's Synthetic Minor Source status.

Under SDAPCD rules, BACT must be applied to "any new, modified, relocated, or replacement emission unit which is required to obtain an Authority to Construct and/or Permit to Operate pursuant to Rule 10, which will result in an increased potential to emit, and which has a post-project potential to emit 10 or more pounds per day of the pollutant being increased" (SDAPCD, 2011). BACT is determined on a pollutant by pollutant basis, and pollutants included in this rule are inhalable particulates (PM<sub>10</sub>), NO<sub>x</sub>, volatile organic compounds (VOCs), and sulfur oxides (SO<sub>x</sub>). In addition to the BACT determinations presented in the SDACPD BACT Guidance Document, BACT determinations from CARB and the federal Environmental Protection Agency (EPA) may be applied at the discretion of SDAPCD. It is important to note that BACT is a continuously

changing standard, and BACT determinations presented in this document may not be considered BACT when a new or modified permit is pursued.

Relevant federal regulations include the New Source Performances Standards (40 CFR Part 60) and the National Emission Standards for Hazardous Air Pollutants (40 CFR Part 63). While BACT only applies at the time of permitting, performance standards are always applicable. These standards are specified for different types of equipment, and specific applicable emissions restrictions are presented in the following subsections.

When evaluating alternatives presented in TMs 3, 4, and 5, compliance with BACT and any other relevant air pollution regulations has been included in the analyses. Compliance with these air regulations will be considered in all future analyses, as well. Specific BACT and regulatory requirements for alternatives that produce emissions and pass fatal-flaw filters in TMs 3, 4, and 5 are discussed in this section.

#### 2.1 Biosolids Drying - Thermal Dryer

EWPCF has one existing Andritz DDS40 biosolids dryer that is fueled by a mix of digester gas and natural gas. The fuel mixture is approximately 80 percent natural gas and 20 percent digester gas, and approximately 9 MMBtu/hr of fuel is consumed. The current fuel consumption was calculated assuming the dryer opperates 11 days every two weeks. The dryer is capable of utilizing a fuel mix with up to 80 percent digester gas; however, this fuel mixture has not been tested. Exhaust from the dryer furnace is treated by a wet scrubber and a RTO that is fueled by natural gas.

As discussed in TM 2, drying capacity may be increased. A second biosolids dryer may be installed, which will require a new air permit application. Additionally, the digester gas compostion of the dryer fuel may be increased. EWA is in ongoing discussions with Andritz on how to modify the Solids Building to accommodate dryer modifications, but do not anticipate these changes will impact the air permit. Since plans to modify the building are not finalized, the permit should be revisited once the size of the dryer and RTO are selcted.

Biosolids dryers are not covered in SDAPCD's BACT Guidance Document, but the CARB BACT Clearinghouse contains BACT determinations for large industrial ovens and dryers. BACT determinations are available for units with capacities between 1.9 MMBtu/hr and 96 MMBtu/hr. For all units within this range, low-NO<sub>x</sub> burners are considered BACT.

### 2.2 Internal Combustion Engines

Increasing the fuel input to the existing IC engines at EWPCF has been presented as an alternative power production strategy in TM 3. As stated in Section 1.1, EWA received a modification to the existing IC engine permits that allows expanded digester gas and natural gas use. Increasing fuel use beyond these new permit regulations will trigger BACT.

Lean-burn IC cogeneration engines fueled by digester gas and natural gas are not covered in SDAPCD's BACT Guidance Document; however, BACT information for these engines is contained within the CARB BACT Clearinghouse. According to the BACT Clearinghouse, BACT for NOx, CO, and VOC control is selective catalytic reduction (SCR) combined with an oxidation catalyst. However, installing and maintaining a SCR system is typically cost prohibitive, and SDAPCD has historically not required SCR for digester gas fueled IC engines.

Expanding IC engine operation under the new air permit may cause EWPCF's CO emissions to increase beyond the Major Source threshold. In this case, EWA may reduce engine operation to limit CO emissions, or oxidation catalysts can be added to reduce CO emissions while maximizing engine output. If oxidation catalysts are installed, an upstream gas conditioning system must also be installed to reduce harmful contaminants that can poison catalysts. Oxidation catalysts are relatively inexpensive compared to full SCR systems and can be economical options for controlling CO emissions.

SCR and oxidation catalysts both operate via catalysis, which is a process that significantly increases the rate of a chemical reaction. SCR systems are active abatement devices in which ammonia ( $NH_3$ ) is injected as urea and reacts with  $NO_x$  molecules in the IC engine exhaust to produce nitrogen and water vapor. Oxidation catalysts are passive abatement devices that reduce CO and VOCs to  $CO_2$  and water vapor; no additional reactants must be supplied for the oxidation process. An exhaust treatment process flow diagram is provided in Figure 2-1.

Figure 2-1. A post-combustion exhaust treatment system, including an oxidation catalyst, urea dosing, and an SCR unit

In addition to BACT, state and federal performance standards apply to operation of natural gas and digester gas fueled IC engines. Relevant standards are presented in Table 2-2. These standards are preliminary determinations, and specific limits are applied when an emissions source is permitted.

Table 2-1. Relevant Federal Emissions Regulations for IC Engines					
Requirement	Limit	Units	Regulation		
Formaldehyde, reduction	76 or greater	%	40 CFR Part 63 Subpart ZZZZ		
Formaldehyde, emissions limit	350	ppbv	40 CFR Part 63 Subpart ZZZZ		
NO <sub>x</sub> emissions limit, digester gas	150	ppmv	40 CFR Part 60 Subpart JJJJ		
NO <sub>x</sub> emissions limit, natural gas	82	ppmv	40 CFR Part 60 Subpart JJJJ		
CO emissions limit, digester gas	610	ppmv	40 CFR Part 60 Subpart JJJJ		
CO emissions limit, natural gas	270	ppmv	40 CFR Part 60 Subpart JJJJ		
VOC emission limit, digester gas	80	ppmv	40 CFR Part 60 Subpart JJJJ		
VOC emissions limit, natural gas	560	ppmv	40 CFR Part 60 Subpart JJJJ		

#### 2.3 Microturbines

Microturbines are small combustion turbines that cogenerate heat and electricity and are included in TM 3 as a power production alternative. Digester gas, natural gas, or a combination can be used to fuel microturbines.

As stated in the Section 2 Introduction, BACT must be applied when an emission unit has a potential to emit 10 or more pounds per day of PM<sub>10</sub>, NO<sub>x</sub>, VOCs, or SO<sub>x</sub>. Microturbines are low-emission combustion units, and most available models from Capstone and FlexEnergy do not trigger BACT because full load emissions of each pollutant of concern are below the 10 pounds per day threshold. Of all the Capstone 65 kW AND 200 kW units, only the CR 200 Digester Gas model exceeds one of the BACT thresholds. The CR200 Digester Gas model produces 3.6 lb/MW-hr of CO at full load, which is equivalent to 17.3 lb/day of CO. Even if two 200-kW units are installed, the only BACT exceedance is the CO limit. In this case, an oxidation catalyst would be required. Refer to Section 2.2 for information on using oxidation catalysts to control CO.

#### 2.4 Boilers

In TM 4, the Cambi™ thermal hydrolysis process (THP) is presented as an alternative to increase biogas production. Refer to Section 2.5 for additional air emissions impacts of Cambi™ THP. This process uses medium-pressure steam, which must be produced in boilers. Conventional or composite boilers may be installed as part of this alternative, and boilers may be fueled by digester gas, natural gas, or a combination of the two.

Under SDAPCD rules, new boilers must meet BACT standards. For natural gas boilers with a heat input of less than 50 MMBtu/hr, BACT is a low NO<sub>x</sub> burner, flue gas recirculation, and oxygen controller. According to the SDAPCD BACT Guidance Document, in lieu of meeting the BACT requirement, EWA may choose to limit the potential to emit from the boilers to less than 10 pounds per day. However, CARB and EPA BACT databases contain more stringent for natural gas fueled boilers including EMx, also known as SCONOx<sup>TM</sup>, and SCR. Refer to Section 2.2 for a description of SCR. EMx has been shown to achieve lower NO<sub>x</sub> emissions than SCR under some conditions.

EMx operates via a catalysis/absorption cycle to remove  $NO_x$  and CO. The system employs a platinum catalyst impregnated with potassium carbonate. Both  $NO_x$  and CO are oxidized by the platinum catalyst, and the oxidized  $NO_x$  reacts with the potassium carbonate and is absorbed within the catalyst surface. Potassium carbonate must be regenerated with hydrogen when saturated with  $NO_x$ . The regeneration process must take place in an oxygen-free environment, which is achieved via valves and louvers. Elemental nitrogen and water vapor are released during regeneration. Various sections of catalysts alternate between oxidation/absorption and regeneration. There are several critical issues associated with EMx that should be considered, including sensitivity to sulfur, safety issues with use of hydrogen, and a high capital cost.

Flue gas recirculation diverts flue gases from the boiler exhaust stream to the combustion chamber, which reduces the peak flame temperatures, decreases the oxygen content in the combustion air, and slows the combustion process. This process controls thermal  $NO_x$  formation, which occurs at higher combustion temperatures and oxygen contents. A flue gas recirculation system for a boiler is shown in Figure 2-2. Oxygen controllers reduce  $NO_x$  by limiting the amount of excess air provided for the combustion process, which controls the oxygen to fuel ratio.

Figure 2-2. Flue gas recirculation in a natural gas boiler.

Source: Bosch.

In addition to BACT, state and federal performance standards apply to operation of natural gas and digester gas fueled boilers. Relevant standards are presented in Table 2-2. These standards are preliminary determinations, and specific limits are applied when an emissions source is permitted.

Table 2-2. Relevant Federal Regulations for Boilers				
Requirement	Limit	Units	Notes	Regulation
CO emissions limit, gaseous fuel	130	ppmv	Dry basis, corrected to 3 % oxygen	40 CFR Part 63 Subpart DDDDD
Hydrogen chloride, gaseous fuel	1.7 x 10 <sup>-3</sup>	lb/MMBtu of heat input	N/A	40 CFR Part 63 Subpart DDDDD
Mercury, gaseous fuel	7.9 x 10 <sup>-6</sup>	lb/MMBtu of heat input	N/A	40 CFR Part 63 Subpart DDDDD
Filterable PM, gaseous fuel	6.7 x 10 <sup>-3</sup>	lb/MMBtu of heat input	N/A	40 CFR Part 63 Subpart DDDDD

#### 2.5 Flare

As stated in Section 1.1, the current flare permit allows digester gas usage of 300 million scf/year. Current digester gas production at EWPCF is below this limit, but, according to TM 1, digester gas production is projected to exceed 300 million scf/year between 2020 and 2030. These projections assume that high strenth waste (HSW) codigestion remains constant. If EWPCF starts accepting additional HSW deliveries, digester gas production may exceed the flare permit limit earlier than 2020. At current conditions, codigesting an additional 7,000 lb of HSW will cause digester gas production to exceed the flare permit limit.

Installation of a higher capacity flare will be required when digester gas production exceeds the current permit's limit, and a modified flare permit must be obtained. The new flare should be sized with digester gas production projections in mind.

#### 2.6 Odor Control

EWPCF currently has three odor reduction facilities (ORF1, ORF 2, and ORF3). ORF 1 and ORF 3 are covered under a single air permit, and ORF 2 is covered under the permit for the biosolids processing facility. Cambi™ THP and increased codigestion, which are discussed in TMs 2 and 4, may produce additional odors that are subject to regulation. If impacts to the existing odor reduction facilities exceed the current air permit limitations, a modified air permit for odor reduction must be developed. Odor mitigation measures and possible air permitting requirements are included in current analyses and will be considered in future analyses.

#### 2.7 Other Alternatives

There are several other alternatives that have passed the fatal-flaw filters in TMs 3, 4, and 5 that may or may not require air permitting.

Cambi<sup>™</sup> THP, which is mentioned in Section 2.4, usually increases the NH<sub>3</sub> content in digester gas, which results in greater NO<sub>x</sub> formation during combustion in an engine, flare or dryer, and can cause exceedances of emissions limits. To avoid potential NO<sub>x</sub> issues, NH<sub>3</sub> removal can be added to a gas conditioning system.

Gas conditioning systems can be considered permittable abatement devices because these systems reduce the concentrations of regulated air pollutants in digester gas, including SO<sub>x</sub> and NO<sub>x</sub>. An air permit is required for a gas conditioning system if employed in conjunction with a combustion process (e.g. an IC engine, microturbine, and/or a flare). An air permit is not required if the gas conditioning system is associated with a permit-exempt emission source.

A digester gas upgrading system for either pipeline injection or direct vehicle fueling may also require an air permit. Upgrading systems separate the methane and carbon dioxide in digester gas, which produces a methane-rich product gas and a tail gas that is mostly carbon dioxide. The tail gas may or may not contain a significant quantity of methane, depending on the separation efficiency of the digester gas upgrading process. Separation efficiencies typically vary between 90 percent and 99+ percent. If the tail gas contains a significant quantity of methane, air permitting and emissions control will most likely be required. Even if tail gas has a negligible methane concentration, an air permit may still be required.

Although digester gas storage does not produce or affect emissions, adding digester gas storage changes the currently permitted process, which requires a permit modification.

Small-scale and large-scale solar photovoltaics do not require an air permit.

### **Section 3: Future Regulations**

New regulations and regulatory trends that may impact future air permitting for EWPCF were assessed as part of this TM. Two relevant regulatory developments were identified, California Assembly Bill 617 and forthcoming SCR requirements. Brief descriptions of these regulatory developments are provided in this section.

### 3.1 California Assembly Bill 617

The State of California recently passed Assembly Bill (AB) 617 Nonvehicular Air Pollution: Criteria Air Pollutants and Toxic Air Contaminants, which has a wide range of impacts on air regulations. The most relevant change of AB 617 is that it requires air districts to adopt an implementation schedule for best available retrofit technology (BARCT) that applies to all emissions producing equipment that received new or revised air permits prior to 2007. Eligible equipment must be upgraded by December 31, 2023. In other

words, even if no major modifications are made to a piece of equipment, that equipment must comply with the appropriate air district's new BARCT regulations if it was permitted prior to 2007.

### 3.2 SCR for All Digester Gas Fueled IC Engines

Air districts in the state of California may move to require SCR emissions control as BACT for all digester gas fueled IC engines in California. The Bay Area Air Quality Management and South Coast Air Pollution Control Districts have been the first districts to implement this requirement for SCR, and California's other air districts may follow this lead. It is uncertain when California's other air districts may adopt these stricter SCR requirements, but it is important for facilities with digester gas fueled IC engines to be aware of this trend.

### **Section 4: Greenhouse Gas Inventory**

A GHG inventory was performed for the existing gas utilization technologies, including the engines, thermal biosolids dryer, RTO, and flare. This section also includes a discussion on the potential GHG reductions associated with future energy production alternatives.

#### 4.1 Introduction to GHG Scope Emission Categories

GHG emissions estimates are categorized as Scope 1, Scope 2, or Scope 3. Scope 1 emissions are direct GHG emissions from within a given boundary; the boundary for EWPCF's Scope 1 GHG emissions estimates developed in this TM include combustion emissions from the 1) engines, 2) thermal dryer, 3) flare, and 4) RTO. Combustion of anthropogenic fuels such as natural gas contributes to GHG emissions as well as byproducts such as  $CH_4$  and  $N_2O$  from incomplete combustion of biogenic fuels such as biogas. GHG emissions from biogas combustion are considered biogenic and do not count towards the total emissions, but are still reported.

Scope 2 GHG emissions are associated with energy purchased through SDG&E and use the published 2014 V2 eGRID CO<sub>2</sub> emissions factor for the CAMX – WECC California subregion.

(https://www.epa.gov/sites/production/files/2017-02/documents/egrid2014\_summarytables\_v2.pdf). Scope 2 GHG emissions estimates are included as part of this analysis and include EWPCF's entire operational boundary, including headworks, solids treatment, liquids treatment, building, and lighting. All energy purchased through SDG&E that is recorded on EWPCF's meter contributes to Scope 2 estimates in this TM.

Scope 3 GHG emissions are indirect emissions that are not covered under Scope 1 or 2, such as emissions from biosolids hauling. Scope 3 sources are not included in the GHG emissions estimates reported in this TM. Figure 2-1 provides a graphical representation of the three Scopes that contribute to the GHG emissions inventory. Scope 3 sources are shown in Figure 2-1 only for informational purposes.

GHG emissions estimates in this analysis are based on fuel consumption during the baseline period (June 2016 to May 2017) presented in TM 1.

Figure 2-1. Scope 1, 2 and 3 emission categories that contribute to a typical GHG Inventory.

Only Scopes 1 and 2 are included in this TM.

#### 4.2 Current Baseline GHG Emissions

To determine the GHG inventory for the engines, biosolids thermal dryer, RTO, and flare, The Climate Registry (TCR) General Reporting Protocol (GRP) version 2.1, January 2016, methodology was applied. Equations from Chapter 12: Direct Emissions from Stationary Combustion of the GRP were used in the calculations. Additionally, the following tables from the March 2017 version of the Default Emissions Factors were used:

- Table 12.1 U.S. Default Factors for Calculating CO2 Emissions from Fossil Fuel
- Table 12.9.1 Default CH<sub>4</sub> and N<sub>2</sub>O Emission Factors by Fuel Type Industrial and Energy Sectors
- Subregion Emissions Greenhouse Gasses (eGRID2014v2), CAMX WECC California eGRID subregion

The estimated total GHG emissions within the established Scope 1 and 2 boundaries are 4,312 metric tons of carbon dioxide equivalents ( $CO_2e$ ). This estimate does not include combustion emissions from digester gas, which are reported separately; however, emissions from incomplete combustion of digester gas is considered Scope 1. Figure 3-2 shows the fraction of GHG emissions that each Scope 1 source contributes and Table 3-1 summarizes these values.

Figure 3-2. Fraction of Scope 1 GHG emissions estimates from each source

Table 3-1. Scope 1 GHG Emissions Estimates							
Combustion Device	Annual NG Combustion (SCF)	Annual DG Combustion (MMBtu)	Direct CO <sub>2</sub> e (metric tons)	CH <sub>4</sub> as CO <sub>2</sub> e (metric tons)	N <sub>2</sub> O as CO <sub>2</sub> e (metric tons)	Incomplete Biogas Combustion (metric tons CO <sub>2</sub> e)	Total CO <sub>2</sub> e (metric tons)
Engines 1-4	11,563,000	11,563	614	0	0	30	644
Dryer	50,789,368	50,789	2,695	1	1	2	2,700
RTO	3,929,441	3,929	208	0	0	0	209
Flare	598,643	599	32	0	0	4	36
Total				3,588 Metric 1	Tons .		•

<sup>1.</sup> Emission factors for CO $_2$ , CH $_4$ , and N $_2$ O are 53.06 kg/MMBtu, 0.001 kg/MMBtu, and 0.0001 kg/MMBtu, respectively.

The intergovernmental Panel on Climate Change (IPCC) *Guidelines for National Greenhouse Gas Inventories* requires that  $CO_2$  emissions from biomass combustion be reported separately from Scope 1 direct emissions. The  $CO_2$  emissions from biogas combustion total 7,257 metric tons of  $CO_2$ . Figure 3-3 shows the fraction of GHG emissions that each combustion source contributes and Table 3-2 summarizes these values.

<sup>2.</sup> Global Warming Potential for CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O is 1, 28, and 265, respectively.

Figure 3-3. Fraction of GHG Emissions from biomass fueled combustion devices

Table 3-2. Biogas Combustion Biogenic GHG Emissions					
<b>Combustion Device</b>	Annual Biogas Combus- tion (SCF)	Annual Biogas Combustion (MMBtu)	CO₂e (metric tons)		
Engines 1-4	205,734,000	115,211	5,999		
Dryer	16,526,871	9,255	482		
Flare	26,600,529	14,896	776		
Total	7,257 Metric Tons				

<sup>1.</sup> Emission factors for CO<sub>2</sub> is 52.07 kg/MMBtu.

### 4.3 GHG Emissions Related to Energy Production Alternatives

GHG emissions estimates will vary depending on the alternative energy production technology selected under Task 3 and the HSW quantities reviewed in TM 4. The alternatives that are being considered in the Solids Water Energy and Emissions Tracking (SWEET) model that would impact the GHG emissions compared to the current baseline include the following:

- Increasing the quantity of HSW to increase biogas production
- Gas conditioning and selective catalytic reduction (SCR) engine exhaust treatment to increase engine power output
- Upgrading biogas to renewable natural gas (RNG) and purchasing power from SDG&E
- Adding solar photovoltaics to the current engine operation

<sup>2.</sup> Global Warming Potential for CO2 is 1.

The GHG impact of each technology is discussed below.

- Increased HSW for codigestion will increase biogas production, which decreases anthropogenic GHG
  emissions but increases biogenic GHG emissions. Since biogas combustion does not count towards
  anthropogenic Scope 1 GHG emissions, producing additional biogas to offset natural gas consumption
  will lower EWPCF's anthropogenic GHG emissions.
- Sending more biogas to the engines instead of the thermal dryer will not have an impact on GHG
  emissions.
- Upgrading biogas to RNG for pipeline injection will increase Scope 1 and Scope 2 anthropogenic GHG emissions. EWPCF currently runs two 750-kW IC engines at full load, primarily on biogas. Sending all biogas to the pipeline will result in increasing natural gas fired combustion (Scope 1 anthropogenic) in the engines or purchasing electricity directly from SDG&E (Scope 2). Carbon dioxide in the tail gas from the biogas separation process also adds to Scope 1 GHG emissions. Transferring the product to the pipeline would not credit EWPCF with replacing an anthropogenic fuel with a biogenic fuel.
- Large-scale and small-scale solar photovoltaics will decrease Scope 2 GHG emissions. Solar PV panels
  do not emit GHGs and reduce the amount of energy that EWPCF would need to purchase from SDG&E or
  produce from the engines.

#### STARTUP AUTHORIZATION

After examination of your Application APCD2017-APP-004926 for an Air Pollution Control District (hereinafter referred to as "the District") Authority to Construct and Permit to Operate for equipment located at 6200 Avenida Encinas Carlsbad CA 92011 in San Diego County, the District has decided on the following actions:

This Startup Authorization is granted pursuant to Rule 21 of the Air Pollution Control District Rules and Regulations for equipment to consist of:

Modification to conditions of Permits 000542, 000543, 000544, 000545 for four identical cogeneration engines: Caterpillar lean burn engine, model G3516, S/Ns 4EK05160, 4EK05161, 4EK05168, 4EK05175, fueled with digester gas and supplemented with natural gas, rated at 1306 bhp when fueled with digester gas and 1085 bhp when fueled with natural gas, each engine drives a 750 KW generator.

This Startup Authorization is issued with the following conditions:

- When fueled with digester gas, the emissions of oxides of nitrogen (NOx) shall not exceed 47 parts per million by volume (ppmv), calculated as nitrogen dioxide at 15 percent oxygen on a dry basis.
- When fueled with digester gas, the emissions of carbon monoxide (CO), shall not exceed 400 ppmv, calculated at 2. 15 percent oxygen on a dry basis.
- 3. When fueled with natural gas, the emissions of oxides of nitrogen (NOx) shall not exceed 54 ppmv, calculated as nitrogen dioxide at 15 percent oxygen on a dry basis.
- When fueled with natural gas, the emissions of carbon monoxide (CO), shall not exceed 390 ppmv, calculated at 4. 15 percent oxygen on a dry basis.
- 5. Total digester gas and natural gas consumption for the four engines of Permit Nos. APCD2010-PTO-000542, APCD2010-PTO-000543, APCD2010-PTO-000544 and APCD2010-PTO-000545 shall not exceed 280 million standard cubic feet per year. Total natural gas consumption for all four engines shall not exceed 28 million standard cubic feet per year. Records demonstrating compliance with these limits shall be maintained on site and made available for inspection upon request. (NSR)
- Total digester gas consumption for the four engines of Permit Nos. APCD2010-PTO-000542, APCD2010-PTO-000543, APCD2010-PTO-000544 and APCD2010-PTO-000545 shall not exceed 1 million standard cubic feet per day. Total natural gas consumption for all four engines shall not exceed 0.55 million standard cubic feet per day. Records demonstrating compliance with these limits shall be maintained on site and made available for inspection upon request. (NSR)
- The owner or operator of each engine shall conduct periodic inspections of each engine and add-on control 7. equipment to ensure that each engine is operated in compliance. Inspections shall be conducted at least once every 4,000 hours of operation or every six months, whichever occurs first. [R69.4.1]
- The owner or operator of this engine shall conduct periodic maintenance of the engine and add-on control 8. equipment, if any, as recommended by the engine and control equipment manufacturers or as specified by the engine servicing company's maintenance procedures. The periodic maintenance shall be conducted at least once each calendar year. (Rule 12, Rule 69.4.1)

9. This equipment shall be source tested once each permit year (annual source test) to demonstrate compliance with the emission standards contained in this permit. For the purposes of this permit, a permit year is the 12-month period ending on the last day of the permit expiration month. It is the responsibility of the permittee to schedule the source test with the District. The source test shall be performed or witnessed by the District. Each annual source test shall be separated by at least 90 days from any annual source test performed in a different permit year.

- The engine shall be source tested annually to demonstrate compliance with the emission standards contained in this permit. Source testing shall be performed using the fuel with higher annual fuel consumption (in standard cubic feet) during the previous calendar year.
- The owner or operator of the engine shall maintain records containing, at a minimum, the following: total daily and annual fuel consumptions of all four engines of Permit Nos. APCD2010-PTO-000542. APCD2010-PTO-000543. APCD2010-PTO-000544 and APCD2010-PTO-000545; records of periodic inspection and maintenance for the engines and control equipment, including dates inspection and maintenance were performed and copies of manuals of recommended maintenance procedures provided by the manufacturer.
- All records shall be retained on site for at least three (3) years and made readily available to the District upon request.
- 13. Access, facilities, utilities and any necessary safety equipment for source testing and inspection shall be provided upon request of the Air Pollution Control District.
- This Air Pollution Control District Permit does not relieve the holder from obtaining permits or authorizations required by other governmental agencies.
- The permittee shall, upon determination of applicability and written notification by the District, comply with all applicable requirements of the Air Toxics "Hot Spots" Information and Assessment Act (California Health and Safety Code Section 44300 et seq.)

**Startup Authorization Expires:** 

May 8, 2018

This authorization is for temporary operation of the above-specified equipment. This temporary Permit to Operate will remain in effect, unless withdrawn or modified by the District or a Permit to Operate is granted or denied.

This Startup Authorization shall be posted on or within 25 feet of the described equipment or maintained readily available at all times on the operating premises.

This Startup Authorization does not relieve the holder from obtaining permits or authorizations, which may be required by other governmental agencies. This Startup Authorization is not an authorization to exceed any applicable emission standard established by this District or any other governmental agency. This authorization is subject to cancellation if any emission standard or condition is violated.

Within 30 days after receipt of this Startup Authorization, the applicant may petition the Hearing Board for a hearing on any conditions imposed herein in accordance with Rule 25.

This Startup Authorization will expire on May 8, 2018, unless an extension is granted in writing.

If you have any questions regarding this action, please contact me at (858) 586 2747 or via email at camqui.nguven@sdcountv.ca.gov.

# **Executive Summary**

The Encina Wastewater Authority (EWA) has undertaken a Biosolids Energy and Emissions (BEE) Plan that will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan provides a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat; addresses capacity limitations in the solids handling process at the Encina Water Pollution Control Facility (EWPCF); assesses which alternative is likely to be the most cost-effective and sustainable solution for EWA, and develops plans to move EWPCF toward lower energy costs, rate stability, greater overall sustainability, and reduced greenhouse gas emissions.

The approach of this work is to allow for consideration of all feasible alternatives, evaluation of all economic impacts, and consideration of non-cost risks in the development of defensible recommendations for future capital projects. This Technical Memorandum (TM) 7 presents the results of the end-to-end alternatives development, the evaluation process, and selection of a recommended alternative. Project alternatives were first screened in TMs 2 through 5, and shortlisted, via a fatal-flaw filter and an initial evaluation scoring for all solids processes, energy utilization alternatives, and waste heat recovery options. Alternatives that passed the screening criteria were then further analyzed using Brown and Caldwell's (BC's) Solids Water Energy Evaluation Tool (SWEET). TM 7 includes results from SWEET evaluation work, recommendation of a preferred alternative, and considerations for implementation of the recommended alternative.

The SWEET model is an Excel based computational spreadsheet developed over years from numerous designs for the quick and efficient analysis of numerous combinations of alternatives for solids processes, biosolids management and end use, co-digestion, and energy recovery. The tool evaluates process and energy demands and compares alternatives on an economic basis using capital and operating costs. The screened recommendations from the work described in TMs 2 through 6 were combined, evaluated with SWEET, and presented to EWA staff through multiple workshops. All alternatives were ranked based on the 20-year net present value (NPV). The key findings of the analysis are listed below:

- All alternatives benefited from increased digester gas (DG) production from co-digestion of organic highstrength waste (HSW). HSW is a general term that encompasses all imported waste streams that are typically highly digestible and contain high quantities of organics such as fats, oils and grease (FOG), liquid waste (i.e., brewery waste), and source separated organics or food waste.
- Improved thickening with rotary drum thickeners (RDT) provides multiple benefits, including increasing
  the capacity of the existing digesters, and reduced lifecycle costs compared to the existing thickening
  scheme.
- Installation of RDTs increases digester capacity and allows for implementation of a food-waste program.
- Upgraded DG for use as vehicle fuel, via pipeline injection, provides the greatest apparent return on investment compared to cogeneration systems or DG use in the solids dryer.

Through a comparison of NPV and site-specific constraints, five preferred alternatives were identified for detailed consideration in this TM. These alternatives include:

- Alternative 1: RDT-Mesophilic Digestion-Centrifuge Dewatering-One dryer-(Engines+Pipeline Injection)
- Alternative 2: RDT-Mesophilic Digestion-Centrifuge Dewatering-Two dryers-(Engines+Pipeline Injection)
- Alternative 3: RDT-Thermophilic 15-day Digestion-Centrifuge Dewatering-One dryer-(Engines+Pipeline Injection)
- Alternative 4: RDT-Thermophilic 15-day Digestion-Centrifuge Dewatering-Two dryers-(Engines only)
- Alternative 5: RDT-Thermophilic 10-day Digestion-Centrifuge Dewatering-Two dryers-(Engines+Pipeline)

Figure ES-1. Overall NPV for top five alternatives

The economic evaluation of the top 5 alternatives indicated that the NPV results of these alternatives were similar and within the anticipated margin of accuracy for this level of analysis. Therefore, a consideration of non-cost criteria and risks was warranted in selection of a preferred alternative for implementation. Based on a non-cost criteria comparison, the Alternative 2 was identified as the preferred alternative for implementation. Mesophilic digestion was chosen as the preferred digestion process as it is well known and understood by plant staff. It provides enough digester gas to meet EWA's energy recovery goals and can be converted to a thermophilic digestion process any time in the future. Continued operation of the dryer and installation of a second dryer in the future would greatly reduce truck traffic and odors within the plant. It provides end-use resiliency through a Class A pelletized product. Energy recovery was identified as a critical component of the project implementation, and pursuit of multiple energy recovery options is recommended to adopt the best approach for EWA. DG upgrading for pipeline injection and increased cogeneration output are both contingent upon approval from outside agencies. For pipeline injection, the EWA must work toward an interconnection agreement with the natural gas (NG) utility. San Diego Gas & Electric (SDG&E). This process can take up to 2 years and may uncover unforeseen costs or project requirements. For increased cogeneration output, EWA must first work toward another air permit revision with the San Diego Air Pollution Control District, which requires gas conditioning and exhaust treatment. In addition, EWA must develop a net electric metering (NEM) tariff with SDG&E. This will likely require a new interconnection agreement.

Because both primary alternatives (pipeline injection and increased cogeneration output) require work with outside agencies (and associated risks), BC recommends that EWA pursue both options in parallel. EWA should pursue a revised air permit while initiating conversations with SDG&E to perform initial steps for NG pipeline interconnection as well as NEM. These discussions are the first step in determining whether an alternative remains viable. Total project costs for these DG alternatives range from \$3 million to \$22 million, with grant opportunities available for pipeline injection.

Solids process upgrades were also considered in this evaluation. Installation of the RDTs will increase capacity in the existing mesophilic digesters, deferring the need for future digester capacity until 2038 (with the second dryer in operation by 2026). Other processes, such as the thermal hydrolysis process (THP), were considered to identify economic benefits related to the solids dryer capacity and the need for a second dryer; however, these processes were found to have higher economic cost relative to other options. With increased capacity for HSW and the desire to develop a reliable HSW program, it is recommended that the existing high-strength waste receiving equipment be upgraded or a new receiving station installed to improve waste receiving and process control in the future. These expansions should include improvements to facilitate safe and dependable truck traffic through the plant for HSW deliveries.

Digester improvements in terms of upgrading existing mixing systems on Digesters 4, 5, and 6 along with structural modifications will need to be addressed immediately for continued operation. Until the installation of a second dryer, it is recommended that improvements to the Class B loadout are provided to improve reliability of the operation and reduce odor impacts from the plant. This includes upgrades to the existing centrifuges and mechanical piping modifications to allow for simultaneous operation of dryer and loadout of Class B biosolids.

#### **ALTERNATIVE 2: RDT-MESOPHILIC-CENTRIFUGE-2 DRYER**

Figure ES-2. Implementation schedule for preferred alternative

BC recommends the following based on economic and non-economic evaluation:

- Implement common project elements such as thickening improvements (RDTs), digester improvements, HSW receiving, and Class B truck loadout improvements. Continue operation of mesophilic digestion until capacity or energy recovery needs change.
- Plan for implementation of a second dryer.

- Consider construction of gas upgrading to pipeline to capitalize on market opportunities and offset costs
  for needed gas conditioning equipment. First, a capacity analysis should be performed with SDG&E to
  determine the location of the nearest pipeline and the feasibility of accepting biomethane. If the
  capacity analysis indicates SDG&E can accept biomethane, EWA may pursue a private-public
  partnership arrangement to deliver the project (including a HSW receiving facility) without requiring a
  capital outlay from EWA.
- Pursue a new air permit with carbon monoxide (CO) catalyst to increase engine output. If a new air permit can be obtained to allow additional fuel usage in the engine, EWA should initiate discussions with SDG&E for NEM electrical rate schedule to potentially lower power bills and export power.
- Continued use and operation of the cogeneration system is recommended. Any measures that increase
  permitted cogeneration energy production or reduce the cost of electricity should be pursued. An NEM
  tariff would reduce electric utility costs by eliminating the standby charge—it would also allow for power
  export and simplify (or eliminate) the EWPCF's current grid isolation practice. Any air permit revisions to
  allow for greater DG utilization and energy output are recommended. The addition of upstream DG
  conditioning and exhaust treatment using a CO catalyst appears to be the best pathway. Any changes
  that trigger more stringent exhaust treatment measures, such as selective catalytic reduction or
  continuous emissions monitoring systems, should be avoided.
- Installation of a second dryer was identified as the preferred alternative for continued solids processing.
  This alternative had a comparable economic impact relative to the other top-rated alternatives and
  allowed for the best non-cost considerations, including reduced risk management related to biosolids
  management, reduced truck traffic, reduced plant odors, and maximized use of existing infrastructure.
  However, the installation of a second dryer can be deferred by operating a Class B truck loadout until
  other necessary improvements are made to the process (until 2026).
- While the second dryer train does not perform as well on an NPV basis in nearly all alternatives, there are non-cost and practical reasons to implement a second train. The timing of bringing this second train on line to realize the most cost savings will be a very important decision for EWA.

# **Section 1: Introduction**

The Encina Wastewater Authority (EWA) has undertaken a Biosolids Energy and Emissions (BEE) Plan that will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- Provide a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat.
- Address capacity limitations in the solids handling process at the Encina Water Pollution Control Facility (EWPCF).
- Assess which alternative is likely to be the most cost-effective and sustainable solution for EWA.
- Move EWPCF toward lower energy costs, rate stability, and greater overall sustainability.
- Reduce greenhouse gas emissions.

# 1.1 Purpose

This Technical Memorandum (TM) 7 presents the results of the end-to-end alternatives development, the evaluation process, and selection of a recommended alternative. Project alternatives were first screened in TMs 2 through 5, and shortlisted, via a fatal-flaw filter and an initial evaluation scoring. Alternatives that passed the screening criteria were then further analyzed using Brown and Caldwell's (BC's) Solids Water Energy Evaluation Tool (SWEET). TM 7 includes results from SWEET evaluation work. TM 7 is preceded by the following TMs as part of the BEE project:

- TM 1: Baseline Energy Profiles and Projections
- TM 2: Technology Evaluations for Biosolids Handling
- TM 3: Technology Evaluations for Alternative Power Production
- TM 4: Technology Evaluations for Biogas Production
- TM 5: Technology Evaluations for Waste Heat
- TM 6: Air Emissions

### 1.2 SWEET Model

The alternatives analysis uses BC's SWEET model, which tracks volatile solids (VS), inert solids, and water through potential process alternatives and considers energy required to power/heat those processes and forecast energy production and material recovery. It also allows energy balances to be compared with integration of multiple feedstocks, and it allows the carbon footprint of each alternative to be determined. Two notable advantages of SWEET are its ability to evaluate alternatives in real time during workshops and its transparency on all of the factors used.

The SWEET model provides the ability to develop a life-cycle economic analysis for end-to-end alternatives over a specific planning period. A business case evaluation (BCE) consisting of capital costs, operations and maintenance costs, repair and replacement associated with each alternative, and environmental attributes can be generated by running the SWEET model.

BC's approach to developing the SWEET model started with two separate models, one for energy alternatives and one for the solids alternatives. These two models were evaluated separately to determine trends and patterns that would then facilitate screening and/or adding appropriate alternatives into a combined SWEET model. The results from the individual SWEET models for energy and solids are referred to as Round 1A

results; the results from the first comparison of the combined SWEET model are referred to as Round 1B results.

The results from Round 1A were discussed with EWA in two weekly progress conference calls and input from that call provided a basis for developing the end-to-end alternatives for the combined Round 1B model. Results from the combined Round 1B model were presented at Workshop 4 held in December 2017. Discussions from that workshop provided basis for screening out many of the alternatives evaluated in Round 1B and ultimately led to evaluating five top alternatives for Round 2 of the SWEET model.

# **Section 2: Development of SWEET Model**

The SWEET model is an Excel based computational spreadsheet based on numerous designs for the quick and efficient analysis of numerous combinations of alternatives for solids processes, biosolids management and end use, co-digestion, and energy recovery. The tool develops process and energy models and compares alternatives on an economic basis using capital and operating costs. This section describes the process used to develop solids stream alternatives for this BCE, including process assumptions applied, Round 1A end-to-end alternatives, cost assumptions, and solids stream comparison themes.

# 2.1 Process Assumptions

The technologies and options evaluated for each major unit process, along with corresponding process assumptions, are described in this section. Each end-to-end alternative used one or more of the options listed here.

#### 2.1.1 Baseline Solids Model

The baseline model describing the solids process at EWPCF based on plant data from 2015 to 2017 was built using the calibrated mass balance detailed in TM 1. The results of the mass balance were captured in SWEET in a baseline model, which served as a basis for comparison to all end-to-end alternatives.

Each input stream and process is captured in SWEET using a module, where process and energy inputs are provided, and the model performs cumulative solids and power calculations. A single SWEET model constitutes a linear stream of several input and process modules, with all calculations occurring cumulatively. The baseline model was built using 2-year average waste activated sludge (WAS); primary sludge (PS); and fats, oils, and grease (FOG) loads as feedstock inputs, with WAS undergoing thickening using dissolved air flotation (DAF). These three loads were applied as inputs to a mesophilic digestion module, where volatile solids reduction (VSR) was determined by applying a load-weighted composite of assumed VSR for each of the three feedstocks. The digested sludge was fed to a centrifuge module for dewatering, followed by either the production of Class B dewatered cake, or thermal drying to produce Class A pellets.

### 2.1.2 Feedstock Assumptions

The feedstocks assumed as initial conditions for the evaluation of all alternatives are shown in Table 2-1. These values, based on the mass balance detailed in TM 1, were applied to 2017 loads. The projection of loads for future years through 2040 was based on the growth rate determined in the 2015 *Process Master Plan*. The high-strength waste (HSW) loads in terms of FOG were determined based on historical data from EWA and kept static regardless of the alternative under evaluation. Additional HSW loads applied were based on maximizing digester capacity for each digestion alternative under consideration. The excess gas can be utilized for pipeline injection, power generation, the existing solids dryer, or a combination of each.

Table 2-1. Summary of Feedstocks						
Feedstock	Input Flow (gpd)	Input Load, 2018 (lb/d)	TS (percent)	VS (percent)		
PS (thickened)	138,900	47,500	4.1	87		
WAS (thickened)	705,000	29,400	0.5	80		
FOG (as received)	8,720	4,000	5.5	80		
Future HSW Options						
SSO, mesophilic digestion	30,000b	30,000	12	85		
SSO, 10-day thermophilic digestion	80,000b	30,000	12	85		
SSO, 15-day thermophilic digestion	50,000b	50,000	12	85		
Conventional THP	80,000a	80,000	12	85		
Conventional THP, Cambi B2-4 reactors	50,000a	80,000	12	85		
WAS-only THP	30,000a	30,000	12	85		

a. Year implemented would depend on phasing of digester projects over 20-year planning period.

## 2.1.3 Thickening Process Assumptions

The thickening technologies considered in all alternatives were either the existing dissolved air flotation thickeners (DAFTs) or new rotary-drum thickener (RDT) units. All DAFTs were assumed to thicken the WAS stream only, as occurs with current thickening operation. Table 2-2 summarizes the major process assumptions made for DAFTs in the SWEET model. RDT thickening was evaluated as a potential upgrade technology, owing to its higher energy efficiency and its smaller unit footprint compared to DAF thickening. If RDT thickening is implemented, it is assumed to be used to co-thicken WAS and PS streams. Table 2-2 summarizes the major assumptions made for thickening processes in the SWEET model.

Table 2-2. DAF Thickening Process Assumptions					
Parameter	Unit	DAF	RDT		
Stream thickened	-	WAS	WAS and PS		
Solids capture	-	95%	95%		
Thickened sludge TS	-	5.6%	6.0%		
Unit loading lb/d 45,000 25,200					
Process energy consumption	hp	Variable <sup>a</sup>	8		

a. Process energy consumption is calculated using input stream loading in a linear relationship with power, based on historical data.

# 2.1.4 Thermal Hydrolysis Process Assumptions

The thermal hydrolysis process (THP) was evaluated as a potential technology to enhance existing facility capacity and cake quality, obviating the need for subsequent thermal drying. The THP process involves the use of pre-dewatering, followed by dilution, to bring solids content to a target of about 16.5 percent for reactor feed. Pre-dewatering for THP alternatives assumed the use of existing dewatering centrifuges, while final dewatering would be accomplished using other dewatering technology options. The thermal hydrolysis reactors may be sized on solids loading, and several THP alternatives were based on differences in size and

service number of THP reactors. The THP process is followed by standard mesophilic digestion, where the hydrolyzed sludge is diluted to ensure stable digestion operation.

THP was applied to two process streams, spanning several alternatives: conventional, or Class A THP, where all feed streams are fed to THP reactors, and WAS-only THP, where only the WAS stream undergoes THP, and is fed to the digesters along with the other feed streams. Table 2-3 summarizes the major assumptions made for digestion processes in the SWEET model. The Cambi THP system was used as the assumed THP system for evaluation purposes in this project.

Table 2-3. THP Process Assumptions					
Parameter	Unit	Conventional THP	WAS-only THP		
Streams processed	-	WAS, PS, SSO, FOG	WAS		
Pre-dewatering solids capture	-	95%	95%		
Pre-dewatered sludge TS	-	20%	18%		
Pre-dewatering energy consumption	hp	225	125		
THP feed solids content	-	16.5% (avg.)	16.5% (avg.)		
THP steam demand	lb/lb TS	0.9	0.9		
Heat requirement for steam generation	Btu/lb steam	1,197	1,197		
THP boiler efficiency	-	85%	85%		
THP operation temperature	°F	302	302		
THP reactor process energy consumption	hp	100	50		

# 2.1.5 Digestion Process Assumptions

Two major digestion processes were assumed in all alternatives: mesophilic digestion, which is the current process, and thermophilic digestion. Thermophilic digestion was evaluated at 10- and 15-day retention times. VSR in each alternative was calculated as a load-weighted composite of VSR assumptions for each feed stream, as detailed in Table 2-4. To summarize, VSRs for mesophilic digestion were assumed based on historical plant data received from EWA. VSRs for thermophilic digestion at 10-day retention time were assumed to be similar to those for mesophilic digestion. VSRs for 15-day thermophilic digestion were assumed to be higher for WAS and PS streams. Finally, in cases where THP is applied, VSRs are assumed to increase in downstream mesophilic digestion for those feed streams that are hydrolyzed.

Additionally, digestion enhancements to increase capacity or improve cake quality were evaluated in some alternatives, like recuperative thickening with mesophilic digesters, and the use of Class A batch tanks with thermophilic digesters at 10-day retention times. Table 2-4 summarizes the major assumptions made for digestion processes in the SWEET model.

Table 2-4. Digestion Process Assumptions						
Parameter	Unit	Mesophilic	Thermophilic, 10-day	Thermophilic, 15-day	Post-THP Mesophilic Digestion	
Operation temperature	°F	97	131	131	97	
PS VSR	-	65%	68%	68%	68%	
WAS VSR	-	47%	47%	52%	55%	
FOG VSR	-	90%	90%	90%	90%	
SS0 VSR	-	80%	80%	80%	80%	
Gas production	ft <sup>3</sup> /lb VS removed	18	18	18	18	
Energy consumption	hp	Variable a	Variable <sup>a</sup>	Variable <sup>a</sup>	Variable <sup>a</sup>	
Shell heat loss	-	5%	10%	10%	5%	

a. Energy consumption is calculated using input stream loading in a linear relationship with power, based on historical data.

# 2.1.6 Dewatering Process Assumptions (Digested Biosolids)

Three major technologies were evaluated for dewatering, including the existing centrifuges, belt filter presses, and screw presses. Each of these technologies was assumed to dewater all digested sludge. It should be noted that peak day loads that may have been applied for the sizing of processes upstream of digestion may not apply to dewatering, because some equalization is provided by digestion and digested sludge storage, using an existing smaller digester tank. Table 2-5 summarizes the major assumptions made for dewatering processes in the SWEET model.

Table 2-5. Dewatering Process Assumptions						
Parameter	Unit	Centrifuge	Belt Filter Press	Belt Filter Press (THP) a	Screw Press	
Unit loading	lb/d	72,000	48,000	48,000	48,000	
Solids capture	-	95%	90%	95%	90%	
Dewatered cake TS	-	22%	25%	30%	25%	
Energy consumption	hp	Variable <sup>b</sup>	Variable <sup>c</sup>	Variable <sup>c</sup>	35	

a. Belt filter presses are assumed to perform final dewatering on all THP alternatives.

## 2.1.7 Thermal Drying Assumptions

EWPCF currently operates a single thermal dryer to produce dried pellets from dewatered cake. The dryer is operated on a 14-day cycle, where it runs for 11 days and is shut down for routine maintenance during the 3 remaining days. A review of historical data (TM 1) showed some periods of extended dryer outage, when dewatered cake was hauled off site as a Class B product. Of total annual end use production, about 3.6 percent was hauled as cake.

Centrifuge energy consumption is calculated using input stream loading in a linear relationship with power, based on historical data.

c. Belt filter press energy consumption is calculated as 50% of corresponding centrifuge energy consumption.

Among the options considered in all alternatives in connection with solids end use were (1) adding a second dryer to add capacity; (2) continuing to use a single dryer; or (3) using no dryer. In the case of using two dryers, it was assumed that cake would not typically be hauled off site, because of the unlikeliness of both dryers being out of service at the same time. When a single dryer is used, the assumption was made that about 3.6 percent of solids produced continued to be hauled off site as cake on an annual average basis. Alternatives that removed thermal drying completely used THP upstream. The combination of THP/digestion plus thermal drying was deemed to produce a less desirable final product, and the assumption was made that all dewatered cake from THP sludge would be hauled off site as a Class A Cake product. Table 2-6 summarizes the major assumptions made for thermal drying in the SWEET model.

Table 2-6. Thermal Drying Process Assumptions						
Parameter	Unit	Two Dryers	One Dryer	No Dryer		
Unit loading	dtpd	28.5 a	18 b	-		
Dried pellet TS	-	94%	94%	-		
Heat requirement	BTU/lb	1,450	1,450	-		
Energy consumption	hp	Variable c	Variable <sup>c</sup>	0		

- a. Capacity downrated by 5%.
- b. Based on 14-day dryer operation cycle.
- Dryer energy consumption is calculated using input stream loading in a linear relationship with power based on historical data.

# 2.1.8 Baseline Energy Model

The baseline model describing the energy process was first built upon the solids baseline alternative using existing dissolved air flotation thickening, thermal drying, and centrifugal dewatering. Unlike the solids baseline, the energy baseline assumes a thermophilic digestion process, which allows for a higher organic loading rate (i.e., addition of HSW) and the associated increase in biogas production in comparison to mesophilic digestion for a relatively low capital investment. Assuming a greater biogas production provided better financial differentiation between the biogas utilization alternatives. An additional set of baseline scenarios using mesophilic digestion were also investigated.

Each input stream and process is captured in SWEET in a similar process as described in Section 2.1.

#### 2.1.9 Air Permit Restrictions

In November 2017, EWA received a modified air permit for the four existing 750-kilowatt (kW) internal-combustion (IC) engines. The previous permit allowed for a total annual consumption of biogas and natural gas up to 224 million standard cubic feet (MMscf), with a maximum of 24 MMscf of natural gas; the revised permit allows up to 280 MMscf of biogas and natural gas, with a maximum of 28 MMscf of natural gas. Modifying the air permit allows EWA to operate approximately one additional 750 kW engine on a 50 percent load, bringing the total permitted power production up to the current EWPCF demand estimated in TM 1.

Figure 2-1 illustrates the various achievable power outputs for a given biogas and natural gas (NG) volume input within permit restrictions. Lines indicating the permit maximum NG annual usage (y-axis) and total gas usage (x-axis) outline the allowable ranges of biogas and NG usage. There exists a unique combination of each one's annual average flow rates that maximizes engine power output. This point is indicated by the star on Figure 2-1 and it corresponds to a value of 1.92 megawatts (MW), assuming a 34.5 percent engine electrical efficiency. For the scenario in which EWPCF electricity demand is below 1.92 MW, the range of flow rate combinations would yield an engine output equal to EWPCF demand. Depending on whether biogas or NG use is prioritized, the gas use profile can be preferentially adjusted along the desired power output line.

Figure 2-1. Several engine output lines are plotted for combinations of biogas and NG usage
The permitted values of 28 MMscf/year of natural gas and 280 MMscf/year of combined biogas and natural gas are plotted
and outline the limits of engine power production. The green area represents possible combinations of DG and NG use.

These gas use restrictions and optimization strategies were applied to the energy alternatives to maximize electricity generation, pipeline injection of upgraded biogas, or both.

#### 2.1.10 Internal-Combustion Engine Assumptions

IC engines produce power to offset purchased energy and reduce peak demand and non-coincident demand charges. IC engines, however, are subject to standby charges based on installed nameplate capacity. IC engines can operate on biogas, natural gas, or both up to the amount permitted by the San Diego Air Pollution Control District. The production capacity and ultimate power generation of each IC engine module in SWEET was dictated by the air permit and the end-to-end alternative goal (maximize electricity generation or pipeline injection). Table 2-7 summarizes the major process assumptions used for the IC engine units in the SWEET model. Although the installed engine capacity is 2.25 MW, the permit limit of 1.92 MW calculated in Section 2.1.9 was the maximum power output used in the SWEET model. One alternative explores the case where EWA pursues a new air permit, which would likely require engine exhaust treatment, so that EWPCF can run a large-scale cogeneration operation up to 5 MW and export power to its member agencies.

Table 2-7. IC Engine Process Assumptions					
Parameter	Unit	Value			
Engine electrical efficiency: existing engines	-	34.5%			
Engine electrical efficiency: new engines Alternative 12S	-	39%			
Thermal efficiency	-	40%			
Installed capacity	MW	2.25			
NG lower heating value	Btu/ft <sup>3</sup>	909			
DG lower heating value	Btu/ft <sup>3</sup>	560			
Process energy consumption	hp	Variable <sup>a</sup>			

a. IC engine energy consumption is calculated using input stream loading in a linear relationship with power, based on historical data.

Selective catalytic reduction (SCR) is an IC engine exhaust treatment technology that greatly reduces nitrogen oxides emissions and is discussed in TM 4. SCR was originally considered as an alternative for the existing engines to unlock additional engine capacity, but the revised permit achieved the same goal without capital investment. However, SCR is explored in several alternatives in addition to other process changes where engines operate on natural gas.

#### 2.1.11 Gas Conditioning Assumptions

Several alternatives include the addition of a gas conditioning system (GCS) that removes moisture, hydrogen sulfide, siloxanes, and potentially ammonia from digester gas (DG) prior to utilization. While the GCS requires upfront capital costs, the IC engines, solids dryer, and potential microturbines (described below) benefit from cleaner gas being delivered to the equipment. Table 2-8 lists capital and project cost assumptions related to gas conditioning that were used in developing the net present value (NPV).

Table 2-8. Gas Conditioning Cost Assumptions						
Cost Element	Capital Cost	Project Cost				
GCS: 650 scfm	\$3.3M	\$4.3M				
GCS: 800 scfm	\$3.7M	\$4.8M				
GCS: 1,200 scfm	\$4.8M	\$6.2M				

## 2.1.12 Microturbine Assumptions

The installation and use of microturbines increase onsite power production while working around the existing air permit. Microturbines can utilize any digester gas beyond what the current air permit allows the engines to use and are a low-emission technology. Gas conditioning and compression up to 80 pounds per square inch gauge (psig) is required upstream of the microturbines. Table 2-9 lists the process assumptions for microturbine modules in the SWEET model.

Table 2-9. Microturbine Process Assumptions						
Parameter	Unit	Value				
Microturbine electrical efficiency	-	31%				
Thermal efficiency	-	21%				
Installed capacity	MW	0.40				
Microturbine uptime	-	90%				
Process energy consumption	hp	Variable <sup>a</sup>				
Capital cost	\$	4.0M				
Project cost	\$	5.2M				

IC engine energy consumption is calculated using input stream loading in a linear relationship with power, based on historical data.

## 2.1.13 Biogas Upgrading and Pipeline Injection

A biogas upgrading system (BUS) includes the same gas conditioning as conventional treatment, in addition to carbon dioxide (CO<sub>2</sub>) and methane (CH<sub>4</sub>) separation to produce renewable natural gas (RNG) suitable for sale via utility pipeline injection. This system achieves the highest value of biogas if environmental attributes such as renewable identification numbers (RINs) and Low Carbon Fuel Standard (LCFS) credits are in place. The Renewable Fuel Standard (RFS) RINs and LCFS programs are previously discussed in TMs 4 and 8. The pipeline injection alternatives can be standalone or coupled with engine and solar options to offset the amount of power that EWA purchases. BUSs in SWEET were either 800 or 1,400-standard-cubic-foot per minute (scfm) capacity systems. When all biogas is sent to the pipeline, it is assumed that a boiler will provide heat for the digesters. It is more economical to fuel the hot water boiler with natural gas than digester gas because digester gas is significantly more valuable as a renewable fuel. Table 2-10 lists the process assumptions for the biogas upgrading and pipeline injection processes and Table 2-11 summarizes the cost assumptions for the various alternative sizes.

Table 2-10. Biogas Upgrading System Process Assumptions						
Parameter	Unit	Value				
System uptime	-	95%				
CH <sub>4</sub> recovery	-	99.5%				
Installed capacity	scfm	Varies depending on HSW quantity and alternative				
Ethanol LHV	Btu/gal	76,330				

Table 2-11. Pipeline Injection Cost Assumptions						
Cost Element	Capital Cost	Project Cost				
BUS: 1,400 scfm	\$16.9M	\$22.0M				
BUS: 1,200 scfm	\$16.3M	\$21.2M				
BUS: 800 scfm	\$13.0M	\$16.9M				
BUS: 650 scfm	\$11.7M	\$15.3M				
BUS: 200 scfm	\$7.8M	\$10.2M				

Note: These costs assume interconnection fees are included.

#### 2.1.14 Solar

Solar panels installed over the existing equalization basins or aeration basins, or in a 5-acre lot, can provide supplemental power for EWPCF when the IC engines reach permitted capacity or when digester gas is being utilized for pipeline injection instead of onsite power generation. Several SWEET alternatives incorporate solar power in one of these three areas using power generation and cost assumptions listed in Table 2-12. The "capacity factor" listed below refers to the ratio of the expected actual average power output to the installed nameplate capacity of the solar panels.

Table 2-12. Solar Process Assumptions						
Parameter	Value					
Equalization basin installed capacity	MW	0.13				
Aeration basin installed capacity	MW	0.40				
5-acre lot installed capacity	MW	0.80				
Capacity factor	-	18.3%				

#### 2.1.15 Net Electric Metering

Several SWEET alternatives result in EWPCF electricity production that exceeds EWPCF demand. This excess electricity can be sold to the utility for revenue via net electric metering (NEM). Economic assumptions of this process are described in Section 2.2.1. An assumed project cost of \$2 million is assumed for NEM upgrades at EWPCF.

Switching to an NEM tariff would eliminate the current standby charge. This is a significant portion of EWA's electric bill.

#### 2.1.16 Carbon Monoxide Catalyst

Installing a carbon monoxide (CO) catalyst would provide an opportunity for EWA to pursue a revised air permit. The current permit limits the quantity of gas that can be combusted in the engine based on a CO emissions requirement. By installing a CO catalyst on the engine exhaust, CO emissions can be reduced to a level at which a revised air permit allows for additional gas to be combusted. A robust gas conditioning system is required upstream of the engine to remove siloxanes to non-detect levels and prevent catalyst fouling.

# 2.2 Cost Assumptions

The following section describes the various assumptions made on capital costs, operating costs and repair and replacement for SWEET life-cycle cost analysis.

## 2.2.1 Capital Costs

Capital costs were estimated using several sources. Detailed cost estimating was not performed, but in many cases available costs from other appropriate biosolids projects in neighboring areas of Southern California were used. Capital cost estimates in this analysis are considered less reliable than a Class V estimate as defined by the American Association of Cost Engineering (AACE) (minus 50 percent, plus 100 percent). As such, capital cost estimates in this document should be used for comparison only, and not be used for capital budgeting.

Capital costs for each solids/energy option were tabulated based on the following sub-categories:

- 1. Civil and Structural Costs
- 2. Demolition Costs
- 3. Mechanical Costs (Included allowances for mechanical piping and installation)
- 4. Electrical, Instrumentation & Control Costs (Assumed to be 25 percent of mechanical equipment costs)

Project costs were then calculated by applying the following mark ups on the capital costs:

- 1. Contingency= 30 percent
- 2. Engineering and Administration = 20 percent

The following Table 2-13 represents the capital costs for the biosolids alternatives.

Table 2-13. Capital Costs Assumptions for Biosolids Alternatives						
Cost Element	Capital Cost	Project Cost				
Systems						
DAF Rehabilitation (Alts assuming DAFs)	\$3.6M	\$5.6				
RDT (WAS only)	\$4.6M	\$7.2M				
RDT (Co-thickening)	\$5.96M	\$9.3M				
Digester Improvements (Dig 4, 5 & 6)	\$2.39M	\$3.72M				
HSW Receiving Upgrades	\$0.5M	\$0.78M				
New HSW Receiving Station	\$3M	\$4.68M				
Digester (Omnivore I)	\$3.7M	\$5.77M				
Digester (Omnivore II)	\$3.7M	\$5.77M				
Thermophilic 15-day Upgrades	\$2.5M	\$3.9M				
Thermophilic 10-day Upgrades	\$3.69M	\$5.76M				
Centrifuge Upgrades	\$3M	\$4.68M				
Existing Dryer Modifications	\$2M	\$3.12M				
New Second Dryer (Includes dryer modifications)	\$14.52M	\$22.65M				
Class B Truck Loadout and Odor Control	\$10M	\$15.6M				
Truck Traffic Improvements	\$1.5M	\$2.34M				

The following Table 2-14 represents the capital costs for the energy alternatives.

Table 2-14. Capital Costs Assumptions for Energy Alternatives					
Cost Element	Capital Cost	Project Cost			
Systems					
GCS - 650 scfm	\$3.3M	\$4.3M			
GCS - 800 scfm	\$3.7M	\$4.8M			
GCS - 1200 scfm	\$4.8M	\$6.2M			
SCR	\$3.0M	\$3.9M			
CO Catalyst	\$0.7M	\$1.0M			
Microturbines w/ Compression	\$4.0M	\$5.2M			
BUS - 1400 SCFM	\$17.0M	\$22.0M			
BUS - 1200 SCFM	\$16.3M	\$21.2M			
BUS - 800 SCFM	\$13.0M	\$16.9M			
BUS - 650 SCFM	\$11.7M	\$15.3M			
BUS - 200 SCFM	\$7.8M	\$10.2M			
Solar Installation - 130 kW	\$0.4M	\$0.5M			
Solar Installation - 400 kW	\$0.8M	\$1.0M			
Solar Installation - 800 kW	\$1.5M	\$2.0M			
Net Metering	\$1.5M	\$2.0M			

# 2.2.2 Operating Costs

The life-cycle cost evaluation of alternatives includes estimates of both operating costs and capital costs. To the best degree possible, operating cost estimates reflect the actual operating parameters and unit costs at EWPCF. Information was requested and received from EWA operations staff for labor; materials-chemicals; utilities such as water, natural gas (NG), and electricity; and biosolids trucking/disposition costs. Table 2-15 summarizes the basis of operations and maintenance (O&M) costs used. In some cases, future estimates are made for these products or situations.

Table 2-15. Assumptions on Operations and Maintenance Costs					
Cost Element	Value in Model				
Electricity used, \$/kWh	\$0.09				
Exported electricity produced, \$/kWh	\$0.04 (future estimate)

Additionally, incentivized credits for producing RNG are based on current trading values as of November 2017. Broker fees for bundling and selling the RINs and LCFS credits typically range from 15 to 20 percent of the sale. To account for broker fees, the RINs were assigned a lower trading value in the D5 advanced biofuels category; D3 cellulosic RINs currently trade for up to three times the value of D5 RINs, which are generated from HSW in comparison to the D3 RINs, which are generated from municipal wastewater. The RFS and LCFS programs are currently expected to last through 2022 and 2030, respectively. These programs are expected to continue after the published program dates, but are not guaranteed; therefore, the SWEET evaluation conservatively assumes the current program durations.

The life-cycle cost analysis (BCE) was performed over a 20-year period that included a 4.0 percent escalation rate and a 3.5 percent discount rate. No risks associated with equipment failure, operation, and maintenance were included; however, benefits associated for FOG tipping and source-separated organics (SSO) tipping were accounted for in the analysis.

## 2.2.3 Repair and Replacement Costs

Costs associated with repair and replacement of mechanical equipment was assumed to occur once over the 20-year life-cycle analysis. Service life for all mechanical equipment was assumed to be 15 years.

# Section 3: SWEET Model Results – Round 1A

For Round 1A of SWEET analysis two separate models were developed, one for biosolids evaluation and one for energy evaluation respectively. The following sections describe the evaluation of each of the models.

# 3.1 SWEET Round 1A Biosolids Alternatives

End-to-end alternatives were developed using combinations of the above options for thickening, digestion, dewatering, and drying, as deemed relevant. A summary of the solids alternatives considered for Round 1A is provided in Table 3-1.

# 3.1.1 Solids Stream Comparison Themes

To evaluate alternatives in a more definitive manner, alternatives were selected for comparison such that all but one process remain constant. The major comparison themes were thickening, stabilization (digestion), THP. Class A solids production, and thermal drying.

#### 3.1.1.1 Thickening

The two major thickening technologies evaluated—WAS-only thickening using existing DAFTs, and cothickening using RDT units—were compared across varying digestion options: specifically, mesophilic, thermophilic with 10-day retention time, and thermophilic with 15-day retention time with two dryers for thermal drying.

#### 3.1.1.2 Stabilization (Digestion)

As one of the major solids stream processes, digestion processes were also compared internally where variables in other processes were held constant. Alternatives where RDT is used for co-thickening, centrifuges for dewatering, with a single dryer, were used to compare the three digestion processes (mesophilic, thermophilic 10-day, and thermophilic 15-day). Thermophilic digestion with 10-day retention time was also evaluated with the use of batch tanks to produce a Class A Cake, amounting to four stabilization options that were compared within this theme. It is important to mention that Thermophilic 10-day digestion process offers more flexibility in terms of digester capacity by allowing the retention time to go down to 10 days; however, in reality, the thermophilic digesters would normally be operated closer to 15 days' retention time.

#### 3.1.1.3 THP

Several alternatives were considered that use THP/digestion configurations. Two THP configurations were evaluated: one that receives all feed streams, and another that receives WAS only. Several THP reactor sizes were also evaluated within each of these streams, with the differing sizes contributing to varying capital cost. The THP alternatives were compared to corresponding alternatives with mesophilic digestion and thermophilic digestion at a 15-day retention time.

#### 3.1.1.4 Class A Cake Production

Alternatives that produce Class A cake were also evaluated for comparison from an end-use perspective. These included all THP alternatives, and thermophilic digestion alternatives with Class A batch tanks.

	Table 3-1. Overview of Solids Alternatives Evaluated (Round 1A)									
Alternative No.	Stream Thickened	Thickening Process	SSO Input	Thermal Hydrolysis <sup>a</sup>	Digestion Process	Digestion Enhancements	Dewatering Process	Cake	No. of Dryers	Pellets
1	WAS	DAF	Yes	None	Mesophilic	None	Centrifuge	Class B	1	Yes
2	WAS	DAF	Yes	None	Mesophilic	None	Centrifuge	None	2	Yes
3	WAS + PS	RDT	Yes	None	Mesophilic	None	Centrifuge	Class B	1	Yes
4	WAS + PS	RDT	Yes	None	Mesophilic	None	Centrifuge	None	2	Yes
5	WAS	DAF	Yes	None	Thermophilic, 10-day	None	Centrifuge	None	2	Yes
6	WAS + PS	RDT	Yes	None	Thermophilic, 10-day	None	Centrifuge	Sub Class B	1	Yes
7	WAS + PS	RDT	Yes	None	Thermophilic, 10-day	Class A batch tanks	Centrifuge	Class A	1	Yes
8	WAS + PS	RDT	Yes	None	Thermophilic, 10-day	None	Centrifuge	None	2	Yes
9	WAS	DAF	Yes	None	Thermophilic, 15-day	None	Centrifuge	Class B	1	Yes
10	WAS	DAF	Yes	None	Thermophilic, 15-day	None	Centrifuge	None	2	Yes
11	WAS + PS	RDT	Yes	None	Thermophilic, 15-day	None	Centrifuge	None	2	Yes
12	WAS + PS	RDT	Yes	None	Thermophilic, 15-day	None	Centrifuge	Class B	1	Yes
13	WAS + PS	RDT	Yes	Traditional Cambi, B6-4 reactors (1+1)	Mesophilic	None	Belt filter press	Class A	0	No
14	WAS + PS	RDT	Yes	Traditional Cambi, B6-3 reactors (2+1)	Mesophilic	None	Belt filter press	Class A	0	No
15	WAS + PS	RDT	Yes	Traditional Cambi, B6-4 reactors (1+0)	Mesophilic	None	Belt filter press	Class A	0	No
16	WAS	DAF	Yes	Traditional Cambi, B2-4 reactors (2+1)	Mesophilic	None	Belt filter press	Class A	0	No
17	WAS	RDT	Yes	WAS only Cambi, 2+1 B2-4 reactors (1+0)	Mesophilic	None	Belt filter press	None	2	Yes
18	WAS	RDT	Yes	WAS only Cambi, B6-3 reactors (1+0)	Mesophilic	None	Belt filter press	Class B	1	Yes
19	WAS	DAF	Yes	WAS only Cambi, B2-4 reactors (2+0)	Mesophilic	None	Belt filter press	Class B	1	Yes

a. Alternatives using THP assume Cambi reactors. Cambi reactor types are shown, with the number of service and standby units.

#### 3.1.1.5 Thermal Drying

The major options in terms of drying were the continued operation of the single existing thermal dryer, or the operation of two dryers, with the purchase and installation of a new unit. One- and two-dryer alternatives were compared within each digestion option. This included mesophilic digestion, thermophilic at 10-day retention time, thermophilic at 15-day retention time, and WAS-only THP. Conventional THP alternatives were not considered here because they do not assume the need for a dryer.

#### 3.1.2 Economic Evaluation of Solids Stream Alternatives

This section presents the results from the Round 1A SWEET life-cycle analysis for the solids alternatives described previously. The results are presented in the form of bar charts that show the stacking of capital costs and running costs as seen on Figure 3-1. The running costs include all O&M costs, repair and replacement costs, and any associated benefits from FOG and SSO tipping. The stacked bars add up to the NPV over the 20-year planning period for each alternative. The following Table 3-2 shows the breakdown of capital and O&M costs in terms of NPV for all alternatives under evaluation.

	Table 3-2. Cost Summary for Solids Alternatives							
Number	Description	Capital Cost (\$M)	O&M (\$M)	Total NPV (\$M)				
1	DAF-Meso-CD-1D	20.69	107.25	127.94				
2	DAF-Meso-CD-2D	45.13	131.97	177.10				
3	RDT-Meso-CD-1D	24.38	99.30	123.68				
4	RDT-Meso-CD-2D	48.83	124.94	173.77				
5	DAF-Thermo10d-CD-2D	43.10	126.11	169.21				
6	DAF-Thermo10d-CD-1D	22.35	99.77	122.12				
7	RDT-Thermo10d+BT-CD-1D	28.35	102.71	131.07				
8	RDT-Thermo10d-CD-2D	46.80	118.90	165.70				
9	DAF-Thermo15d-CD-1D	24.33	107.62	131.95				
10	DAF-Thermo15d-CD-2D	48.78	132.99	181.77				
11	RDT-Thermo15d-CD-2D	52.48	125.89	178.37				
12	RDT-Thermo15d-CD-1D	28.03	100.26	128.29				
13	RDT-CambiB6-4(1+1)-BFP-0D	88.90	132.17	221.07				
14	RDT-CambiB6-3(2+1)-BFP-0D	99.26	139.40	238.66				
15	RDT-CambiB6-4(1+0)-BFP-0D	74.77	122.42	197.19				
16	DAF-CambiB2-4(4+0)-BFP-0D	75.30	129.52	204.82				
17	RDT(WAS)-CambiB6-2-BFP-2D	100.29	153.55	253.84				
18	RDT(WAS)-CambiB6-2-BFP-1D	75.84	127.66	203.50				
19	DAF(WAS)-CambiB2-4(2+0)-BFP-1D	54.38	130.33	184.71				

a. (Duty + standby) unit configuration for THP reactors.

Figure 3-1. Overall 20-year NPV for solids alternatives

#### 3.1.2.1 Thickening Comparison

Figure 3-2 extracts the comparable thickening alternatives from the broader group presented on Figure 3-1 to allow for easier comparison. Overall, the results displayed on Figure 3-2 suggest that the life-cycle costs of RDTs versus rehabilitation of the existing thickening system are comparable. The similarity in overall NPV for the RDT and DAF alternatives is due to the RDT alternative including a higher capital cost but lower operating costs when compared to the DAF alternative.

In addition, the life-cycle costs demonstrate a payback over the planning period with seven RDTs installed. Another option would be to install fewer units for a lower initial capital cost and expand to all seven units in the future, as solids loads to the EWPCF increase. Aiding the final selection of RDTs is the fact that switching thickening technologies opens valuable plant footprint for other processes.

Figure 3-2. Comparison of thickening systems (assuming two dryers)

#### 3.1.2.2 Stabilization Comparison

Figure 3-3 compares the stabilization options side by side. Note that these alternatives have energy implications that could not be fully analyzed until each alternative was combined with one or more energy alternatives. Items of note regarding the stabilization comparison that could be made from this analysis were:

- It is evident that 15-day thermophilic and mesophilic alternatives perform similarly (Figure 3-3).
- Better distinction between thermophilic 10-day and thermophilic 15-day alternatives can be made once these are evaluated together with energy alternatives.

Figure 3-3. Comparison of stabilization options (assuming RDTs and 1 dryer)

### 3.1.2.3 THP Comparison

The primary purposes of comparing THP alternatives (Figure 3-4) was to identify the best performing configuration for THP at EWPCF. As with the digestion alternatives, a full comparison is not possible without including corresponding energy alternatives. Below are items of note regarding the THP comparison:

- WAS-only THP, designed as a lower capital alternative, does not confer any advantage in terms of eliminating a need for a second dryer or in providing a Class A alternative.
- THP/Digestion alternatives are not combined with thermal drying due to final product concerns.

Figure 3-4. Comparison of THP options

### 3.1.2.4 Class A Comparison

All alternatives that consisted of two dryers, full THP, and 10-day thermophilic with batch tanks were considered to produce Class A out of EWPCF. The results from the evaluation are shown on Figure 3-5 below All Class A alternatives shall be carried forward to the next round of evaluation when combined with energy options to get a clearer picture of how end-use impacts overall life-cycle costs.

Figure 3-5. Comparison of Class A options (assuming RDTs)

### 3.1.2.5 Dryer Evaluation

The main purpose of the dryer comparison was to evaluate the overall performance of one dryer versus two dryers (see following Figure 3-6). The results of the evaluation show that the one dryer alternative (two different biosolids products out of EWPCF) is less costly over the life cycle. All dryer alternatives shall be carried forward to the next round of evaluation when combined with energy options. This would provide a clearer picture on energy utilization since different quantities of digester gas would be sent to the dryer based on type of digestion process under evaluation.

Figure 3-6. Comparison of one dryer versus two dryers

### 3.1.3 Alternative Selection for Combined SWEET Model (Round 1B)

In merging the solids model with the energy model, most of the solids alternatives were selected to be evaluated in the combined SWEET model. Excluding the baseline, alternatives with existing DAFs were screened out as they show a higher life-cycle cost when compared to RDTs, The DAFs are reaching the end of their useful life which implies a significant capital investment would be required to rehabilitate the system and continue operation. RDTs offer a more competitive life-cycle cost over the 20-year period due to its reduced energy demand and maintenance costs. They also have a much smaller footprint which frees up valuable real estate for EWA in the future.

This section reviews the various energy alternatives developed in the first round of the SWEET model and input assumptions used in the NPV evaluation.

# 3.2 SWEET Round 1A Energy Alternatives

The initial list of alternatives based on decisions from Workshop 4 and TMs 3, 4, 5, and 6 is presented below. The following main alternatives were considered:

- 1. Engines (baseline)
- 2. Engines with gas conditioning
- 3. Engines with microturbines
- 4. Pipeline injection
- 5. Hybrid of engines and pipeline injection
- 6. Engines with solar (varying sizes and installation locations)
- 7. NG engines and SCR with all DG to pipeline injection
- 8. NG engines and SCR with all DG to pipeline injection and solar
- 9. Large-scale 5-megawatt (MW) cogeneration facility with NEM

Sub-alternatives are indicated with an S, which indicates HSW co-digestion and, therefore, increased DG production. Table 3-3 lists the SWEET Round 1A energy alternatives evaluated.

	Table 3-3. Overview of Energy Alternatives Evaluated									
Alternative No.	SSO Input	Digestion Process	Gas Conditioning	IC Engine Capacity	Microturbine Capacity	Biogas Upgrading and Pipeline Injection Capacity	Solar	SCR	NEM

a. Assumes a modified air permit.

A 20-year evaluation was performed to determine the NPV of each alternative based on the assumed capital and 0&M costs of Section 2.2. Table 3-4 lists the capital costs, annual 0&M costs, and NPVs of each alternative based on the SWEET model inputs and assumptions described in Section 2. Note that the capital costs for additional infrastructure required for HSW receiving are assumed in the solids capital costs. The same methodology in determining costs for the solids model described in Section 2.2 was used for the energy model. Figure 3-7 provides a visual comparison of each alternative aside from Alternative 14S, which is the only one with a negative NPV.

Table 3-4. Economic Summary for Energy 1A Alternatives						
Number	Description	Capital Cost (\$M)	NPV of O&M (\$M)	Total NPV (\$M)		
1	Base case: engines + DG to dryer		27.5	27.5		
1S	Base case: engines + DG to dryer + HSW	0.5	26.3	26.8

# Net Present Values of Energy Alternatives

Figure 3-7. Comparison of alternatives

Alternative 14S not included.

Several engine output lines are plotted for combinations of biogas and NG usage. The permitted values of 28 MMscf/year of natural gas and 280 MMscf/year of combined biogas and natural gas are plotted and outline the limits of engine power production.

#### 3.2.1 Engine Alternatives

This section presents an economic evaluation of the engine alternatives.

#### 3.2.1.1 Gas Conditioning

Alternatives 2 and 2S build from Alternatives 1 and 1S, respectively, via the addition of gas conditioning. NPV results indicate that 0&M savings from employing gas conditioning over the 20-year period nearly offset the capital cost. Additionally, gas conditioning would also lower 0&M costs of the dryer that are not quantified in this analysis. Therefore, it is recommended that EWA install a gas conditioning system in the near future.

#### 3.2.1.2 Solar

Solar alternatives were coupled with the existing IC engines in Alternatives 6 through 8S, ranging from an additional 130 to 800 kW of electrical output. The HSW addition in Alternatives 6S, 7S, and 8S allows for enough electricity production in the early years of the BCE to earn revenue via NEM. However, this revenue stream dissipates as the EWPCF electricity demand climbs past the generation capacity.

Solar power production capacity is cost-effective when digester gas is limited or prioritized for pipeline injection. When enough digester gas is available for the engines to use to meet EWPCF energy demand, solar power is not needed, which makes it not cost-effective under these circumstances. Conversely, when DG use in the engines is limited because of either short supply or diversion to pipeline injection, installing solar power becomes cost-effective by reducing the amount of electricity EWPCF purchases.

Based on the current energy demands at EWPCF and the results of the analysis indicating that solar alternatives do not provide much of a reduction in O&M costs, installation of solar panels is not a priority.

#### 3.2.1.3 Microturbines

Despite providing excess power generation and electricity revenue in the early years of the BCE, the microturbine alternatives did not result in enough savings or revenue to offset capital costs, leaving them with NPVs higher than the baseline models. Microturbines are not recommended for installation at EWPCF.

#### 3.2.1.4 Large-Scale Cogeneration

Alternative 12S explored the effect of large-scale cogeneration by assuming a revised air permit, which would allow for a total IC engine capacity of 5 MW. The increased capacity allows EWA to export power to its member agencies via NEM sale. This revenue stream makes Alternative 12S one of the more attractive scenarios tested, with an NPV lower than the baseline scenarios. The success of this alternative is due to the efficient utilization of excess biogas and is feasible only when co-digestion is maximized, and therefore is not a priority alternative.

#### 3.2.2 Pipeline Injection Alternatives

This section presents an economic evaluation of the pipeline injection alternatives.

#### 3.2.2.1 100 Percent Pipeline

Alternatives 4 and 4S demonstrate that using 100 percent of EWPCF biogas for pipeline injection does not generate enough revenue to pay back the capital costs and these options raise electricity costs over the 30-year BCE. However, the addition of HSW co-digestion and installation of a higher-capacity BUS allowed

Alternative 4S to collect significantly more revenue and reduce its NPV. This led to the exploration of a hybrid alternative that incorporated engines and pipeline injection, detailed in the following section.

#### 3.2.2.2 Engines with Pipeline Injection

Alternative 5S is a hybrid engine and pipeline injection option that assumes maximizing IC engine output and pipeline injection of excess biogas, which yielded the lowest NPV aside from Alternative 14S. The success of this alternative is similar to that of Alternative 12S, the large-scale cogeneration alternative. Here, the capital improvements of a biogas upgrading and pipeline injection system pay off when co-digestion of HSW is incorporated. Like Alternative 12S, Alternative 5S creates a strong revenue stream using excess biogas from HSW co-digestion to attain environmental attributes and avoid peak and demand electrical charges. This alternative provides operational flexibility to handle peaks in biogas production by sending it to the pipeline while also meeting the EWA goal of power production. A hybrid engine and pipeline injection alternative is recommended for near-term implementation.

#### 3.2.2.3 Pipeline Injection with NG Engines

Alternatives 9 through 10S all combine 100 percent biogas utilization for pipeline injection with SCR-mediated cogeneration using only natural gas. Like Alternative 5S, this scenario allows for maximum IC engine output paired with revenue-generating pipeline injection. The main difference is that Alternatives 9 through 10S prioritize biogas for pipeline injection and use natural gas strictly for IC engine operation. Additionally, SCR allows the engines to produce beyond the permit limit and up to the EWPCF capacity (2.25 MW). While the overall alternative NPV is lower than that of the baseline scenarios, the high capital cost of SCR leaves this alternative with a higher NPV than Alternative 5S. Because these alternatives do not provide significant value and are higher risk than the hybrid engine and pipeline injection project, they are not recommended for implementation.

#### 3.2.2.4 Effect of RINs

The current RFS (RFS2) for RINs does not end in 2022; however, the dictated escalation of required renewable volumes of fuel does stop on December 31, 2022. The rule requires that volume obligations of renewable fuel for years after 2022 be at least equal to, or larger than, the current volume. Because there is uncertainty with the value of future RINs after 2022, the alternatives incorporating pipeline injection assume that the program ends on that day. These alternatives have the potential to generate significantly more revenue while the RFS2 is in place.

Alternatives 13S and 14S were developed to examine how an increase in RIN lifetime affected NPV, assuming IC engines would utilize biogas once incentives ran out. An increase from 3 to 10 years in RIN lifetime between the two resulted in more than \$70 million of additional revenue. Unlike NEM of excess electricity, the sale of biogas through pipeline injection offers two revenue streams: the actual sale of upgraded biogas and the value of RINs. It is likely that RINs will continue to exist for more than 3 years, meaning that a continued financial payback like Alternative 14S can be a likely situation.

#### 3.2.3 High-Strength Waste Addition

A major theme and general conclusion of the SWEET model is that the co-digestion of HSW universally lowered NPV. An assumed capital cost of \$500,000 for HSW receiving infrastructure is quickly paid back because of the revenue generation linked to the additional biogas production. Gas production that exceeds plant demand yields valuable returns with pipeline injection and also reduces purchase of supplemental natural gas. Alternatives 5S, 9S, 10S, and 12S all had lower NPVs than the baseline alternatives because the addition of HSW co-digestion allowed for higher production and utilization of biogas via extra engine capacity or pipeline injection or both.

It should also be noted that not a single alternative without HSW co-digestion resulted in a lower NPV than the baseline alternatives. This shows the resilience of the baseline scenario with a modified air permit as well as the significance of HSW co-digestion in lowering NPV. It is recommended that EWA pursue additional HSW contracts and increasing the size of the existing HSW facility to accommodate a larger co-digestion program.

#### 3.2.4 Alternative Selection for Combined SWEET Model (Round 1B)

In merging the energy model with the solids model, the energy alternatives were narrowed to the baseline cogeneration alternative (status quo) and a hybrid engines and pipeline injection alternative. These two alternatives will be merged with the selected solids alternatives in a combined SWEET model. Both alternatives offered competitive NPVs and potential revenue without significant risks. The results of the initial SWEET analysis indicate that gas conditioning offers O&M benefits and is nearly break-even with the baseline alternative; for this reason, it is not carried forward into the combined SWEET analysis as a separate alternative, but may be considered as having nearly the same NPV as the baseline alternative.

# Section 4: Combined Solids and Energy SWEET Model Results - Round 1B

Analysis of the solids model and the energy model individually provides a distinct picture of how the alternatives perform on their own over the life-cycle. The results from the previous round also provides information to screen out some of the apparent outliers in the solids and energy alternatives in terms of life-cycle costs. On combining the solids and the energy models, a more comprehensive analysis can be made with how the solids processes impact the energy utilization within the plant. The benefits derived from reduced energy requirement affect the overall life-cycle costs.

The combined SWEET model involved merging the solids model and the energy model into one. The combined model then generates the overall life-cycle costs for the end-to-end alternatives. The two primary energy alternatives selected were baseline cogeneration alternative and a hybrid engine and pipeline injection alternative. These two energy alternatives were evaluated with each individual biosolids alternative listed in the following Table 4-1.

### 4.1 Round 1B Alternatives

On analysis of results from Round 1A, a new set of alternatives were developed that combined the solids and energy alternatives into one SWEET model. These end-to-end alternatives were developed using combinations of the above options for thickening, digestion, dewatering, and drying, as deemed relevant.

	Table 4-1. Overview of Alternatives Evaluated (Round 1B) <sup>a</sup>									
Alternative No.	Stream Thickened	Thickening Process	SSO Input	Thermal Hydrolysis <sup>b</sup>	Digestion Process	Digestion Enhancements	Dewatering Process	Cake	No. of Dryers	Pellets

19	WAS	RDT	Yes	WAS only Cambi, B2-4 reactors (1+0)	Mesophilic	None	Belt filter press	Class B	1	Yes
20	WAS	DAF	Yes	WAS only Cambi, B2-4 reactors (2+0)	Mesophilic	None	Belt filter press	Class B	1	Yes
21	WAS + PS	RDT	Yes	None	Mesophilic	None	Screw press	None	2	Yes
22	WAS	DAF	Yes	None	Mesophilic	None	Screw press	None	2	Yes
23	WAS + PS	RDT	Yes	None	Mesophilic	None	Belt filter press	None	2	Yes
24	WAS	DAF	Yes	None	Mesophilic	None	Belt filter press	None	2	Yes

a. Each alternative listed was evaluated with the two primary energy alternatives (Engines only and Engines+Pipeline Injection).

b. Alternatives using THP assume Cambi reactors. Cambi reactor types are shown, with the number of service and standby units.

The following are key items that were included in developing this round of alternatives:

- The two primary energy alternatives include engines only up to existing air permit and engines with pipeline injection.
- Alternatives that evaluated existing DAFs for thickening were screened out except for the one that represents the baseline.
- Additional Cambi reactor sizes were evaluated for THP/digestion alternatives.
- Omnivore technology (Recuperative thickening) was introduced as an option to provide more digester
  capacity and evaluated with mesophilic digestion. In this scenario, the existing small Digesters 1 and 2
  would be repurposed to be used as Omnivore tanks with additional thickening equipment and a new
  mixing system within the tanks.
- Thermophilic digestion at 10-day and 15-day were evaluated with batch tanks to provide Class A Cake.
- Different dewatering technologies such as Belt Filter Press and Screw Press were added to alternatives with two dryers for evaluation.
- One and two dryer alternatives were evaluated due to the non-cost advantages provided by the second dryer.

Each alternative shown in the table is compared with two energy options, one with engines and one with a hybrid of engines and pipeline injection.

## 4.2 Economic Evaluation of Solids and Energy Alternatives

Results from Round 1B of the SWEET life-cycle analysis for all alternatives under consideration are presented on Figure 4-1 below.

Figure 4-1. Overall NPV for all alternatives

From the figure above, it is evident that all the THP options represent a much higher NPV over 20 years compared to the other alternatives. These options were screened out from further consideration, particularly since they do not offer sufficient non-cost advantages to justify the higher cost.

Figure 4-2. Overall NPV for all alternatives without THP

#### 4.2.1 Dryer Evaluation

The following Figure 4-3 compares alternatives with one dryer and two dryers for different digestion scenarios such as mesophilic, thermophilic 10-day, and thermophilic 15-day. Overall, alternatives with two dryers have a higher NPV compared to those with one dryer because of the higher capital cost. The operating and running costs over time for the one- and two-dryer options are comparable. EWA staff felt there were important non-cost advantages to a second dryer, so the decision was made to preserve some two dryer alternatives for the best performing digestion alternatives.

Figure 4-3. One dryer versus two dryers

#### 4.2.2 Final Product Evaluation

The following Figure 4-4 compares alternatives that produce only one type of finished product (Class A pellets) versus producing two types of biosolids products (Class A pellets and Class B cake). The results from this evaluation suggest that the costs to produce only pellets (with two dryers) as the finished product out of EWA is higher than producing a portion of pellets and hauling the remaining Class B cake. The latter has a lower capital cost compared to any option with two dryers, as implied by the previous figure.

Figure 4-4. Class A pellets versus pellets and Class B cake hauling

#### 4.2.3 Source-Separated-Organics Evaluation

The following Figure 4-5 compares options that were evaluated with and without importing SSO. SSO importing was considered additional over the already existing FOG and brewery waste quantities. The results suggest that the life-cycle costs for no SSO are higher than those that do import SSO. This is attributed to the benefits associated with SSO tipping fees and more effective energy utilization in the options that import SSO, and is consistent with the findings of the Round 1A energy evaluation.

Figure 4-5. SSO versus no SSO

#### 4.2.4 Thickening Evaluation

The following Figure 4-6 shows the results of evaluating existing DAFTs with mesophilic digestion versus RDTs with mesophilic digestion. The RDTs have a lower running cost, especially in terms of energy, but a higher initial capital investment. However, over the life cycle the NPV of RDTs is lower than that of DAFs. As mentioned previously, RDTs also provide an important advantage of freeing up valuable footprint on the EWA site.

Figure 4-6. DAF versus RDT

#### 4.2.5 Energy Evaluation

Because the revised engine permit allows for a maximum DG usage of 533 scfm, on average, any DG in excess of the permit limit can either be utilized in the dryer or sent to the pipeline. Or, with a revised air permit, gas conditioning, NEM, and a CO catalyst, additional gas can be utilized in the engines. Figure 4-7 shows the DG production as a function of HSW co-digestion assuming mesophilic digestion in addition to key operating points assuming a current baseline DG production of 500 scfm without any HSW addition.

Figure 4-7. DG production as a function of HSW co-digestion with key operating points

The results of the energy SWEET model were refined for a solids treatment process including RDTs, mesophilic digestion and one dryer based on the feedback from Workshop 4. While the engines only and engines with pipeline injection energy alternatives were carried forward into the Round 1B model, several alternatives were continued to be modeled in conjunction with the preferred solids treatment process. Figures 4-8 to 4-10 show the energy SWEET model results assuming the preferred solids process with varying levels of RINs durations and values. These figures assume 15,000 gallons per day of HSW for codigestion, or approximately 690 scfm of "day 1" DG production.

Figure 4-8. BCE results with HSW and RINs until 2022 (full value) with standby charges removed for all alternatives except base case

Figure 4-9. BCE results with HSW and RINs to 2030 (full value) with standby charges removed for all alternatives except base case

Figure 4-10. BCE results with HSW and RINs to 2030 (half value) with standby charges removed for all alternatives except base case

Based on the findings of the SWEET model, the alternatives EWA should pursue and consider for capital improvement include the following:

- Run engines up to the permit limit and send the remainder of the gas to the pipeline. Pursue an NEM schedule with San Diego Gas & Electric (SDG&E) to avoid standby charges (hybrid engines + pipeline injection).
- Provide gas conditioning upstream of engines followed by a CO catalyst on engine exhaust to unlock
  more engine capacity via air permit modification. Pursue an NEM schedule with SDG&E to avoid standby
  charges (engines + gas conditioning + CO catalyst).

When coupled with the solids alternatives, The SWEET model results indicate the following findings:

- Digester gas is more financially valuable when injected into the pipeline based on current NG prices, LCFS credit prices, and RINs credit prices that provide revenue to EWA. Revenue from LCFS and RINs credits, based on current market value, can provide significant financial value to EWA.
- Regardless of technology, the addition of HSW for co-digestion improves the overall economics, leading
  to a recommendation that EWA increase the size of its HSW receiving facility to accommodate a larger
  co-digestion program.
- EWA should produce as much gas as possible in early years to send as much gas as possible to the pipeline, assuming that RINs values continue to hold the same market value.
- A CO catalyst coupled with gas conditioning offers a viable project with NEM opportunities if a revised air permit can be obtained.

Several of the gas upgrading systems on the market allow provisions for including a separate gas outlet prior to separating CO<sub>2</sub> from the CH<sub>4</sub> stream; this provides EWA with flexibility to route conditioned gas from the gas upgrading system to the engines or boilers if pipeline injection incentives are no longer in place. This conditioned gas would also meet the treatment requirements upstream of the engines if a CO catalyst is installed on the engine exhaust.

# 4.3 Alternative Selection for Combined SWEET Model (Round 2)

As previously stated, RDTs shall be carried over to the next round of evaluation due to its significant advantages over DAFs. Evaluating mesophilic digestion with Omnivore technology shows promise as a viable option due to its lower capital cost and ability to provide more digester capacity in the future. Thermophilic digestion provides some benefits such as increased HSW loading to the digesters and therefore shall be evaluated further. Centrifuges are the current technology used for sludge dewatering and shall be carried over to the next round provided the existing units are upgraded. Although operation of the dryer may not have shown a competitive NPV over the life-cycle, it offers significant non-economic advantages and therefore operation of one dryer and/or two dryers shall be evaluated further.

The results of the combined 1B model as related to the energy alternatives indicates that regardless of solids processes selected, with HSW co-digestion, a hybrid engine and pipeline injection project offers economic benefit over the engine only base case. For this analysis, it was assumed that RINs end in 2022, however, this is a highly conservative assumption. Greater economic upside can be observed as the RIN program continues beyond 2022 as demonstrated in the energy NPV results.

# **Section 5: Combined Solids and Energy SWEET Model Results - Round 2**

Upon selecting the desired top five alternatives to be evaluated for Round 2, the combined SWEET model was customized in a way that would allow the capital and operating costs for the different projects elements to occur at different times over the life-cycle. The combined SWEET model would incorporate phasing different project elements based on capacity requirements, remaining useful life on equipment, and maximum derivable benefits with respect to RINS and LCFS. This is discussed in greater detail in Section 5.3.

Following are the assumptions made for the combined SWEET model Round 2.

- Capital costs for new projects would occur at the mid-point of construction based on when they are
  required to come on line during the planning period. For example, if RDTs were required to be in
  operation by 2021, and assuming it is a 3-year construction project, the capital cost would occur in year
  2020.
- Operating costs for new projects would start at the end of construction and carry over all the way through planning period.
- Repair and replacement costs were assumed to occur once over the planning period. Service life of all mechanical equipment was assumed to be 15 years.
- Material disposition costs in terms of pellets and hauling Class B biosolids would be addressed based
  on operation of one dryer or two dryers. For example, if the second dryer were to be installed in 2026
  material dispositions costs would be calculated for both pellets and Class B biosolids hauling. 2026
  onward, costs for only pellets would be counted toward material disposition.

#### 5.1 Round 2 Alternatives

Discussions from Workshop 4 held in December 2017 resulted in screening out most of the alternatives that were evaluated in the previous round. The following provided the basis for selecting the top five alternatives to be evaluated on cost and non-cost criteria:

- RDTs were chosen as the preferred thickening technology for all alternatives.
- Mesophilic, thermophilic 15-day, and thermophilic 10-day digestion processes were retained for evaluation.
- Centrifuges were chosen as the preferred dewatering technology for all alternatives; however, the existing centrifuges require mechanical upgrades.
- One and two dryers were retained for evaluation. The alternatives with one dryer would now include provisions for a full-fledged truck loadout that facilitates easy thoroughfare for trucks to haul Class B biosolids, following input from EWA staff.
- Engines and pipeline injection were chosen as the preferred energy alternative due to the significant economic advantages it offers over engines only.
- The baseline energy alternative (engines only) was evaluated with the thermophilic 15-day process and two dryers. This option offers a reliable way to achieve Class B and allows for higher quantity of HSW to be accepted and it offers a different way of utilizing the energy while still being competitive with the other alternatives.

A summary of alternatives considered for Round 2 is shown in Table 5-1 below.

	Table 5-1. Overview of Solids Alternatives Evaluated (Round 2)								
Alternative No.	Stream Thickened	Thickening Process	SSO Input	Digestion Process	Dewatering Process	Cake	No. of Dryers	Pellets	Pipeline Injection
1	WAS + PS	RDT	Yes	Mesophilic	Centrifuge	Class B	1	Yes	Yes
2	WAS + PS	RDT	Yes	Mesophilic	Centrifuge	None	2	Yes	Yes
3	WAS + PS	RDT	Yes	Thermophilic, 15-day	Centrifuge	Class B	1	Yes	Yes
4	WAS + PS	RDT	Yes	Thermophilic, 15-day	Centrifuge	None	2	Yes	No
5	WAS + PS	RDT	Yes	Thermophilic, 10-day	Centrifuge	None	2	Yes	Yes

# **5.2 Economic Evaluation of Top Five Alternatives**

Table 5-2 shows the breakdown of the capital and running cost along with the overall 20-year NPV for the top five selected alternatives.

	Table 5-2. Cost Summary for Top Alternatives						
Number	Description	Capital Cost (\$M)	O&M (\$M)	Total NPV (\$M)			
1	RDT-Meso-CD-1D	\$62.5	\$86.1	\$148.6			
2	RDT-Meso-CD-2D	\$72.2	\$93.7	\$165.9			
3	RDT-Thermo15d-CD-1D	\$65.8	\$74.4	\$140.2			
4	RDT-Thermo15d-CD-2D (engines only)	\$61.8	\$94.1	\$155.9			
5	RDT-Thermo10d-CD-2D	\$73.9	\$57.1	\$131.0			

Figure 5-1 below shows results from the SWEET life-cycle analysis of the selected top five alternatives.

Figure 5-1. Overall NPV for top five alternatives

The results suggest that NPV for the mesophilic digestion options is slightly higher than those for the thermophilic 15-day and 10-day alternatives. The key differentiators between the three digestion scenarios are mainly the quantity of HSW imported. The thermophilic options provide a higher organic loading and therefore can allow for larger quantities of HSW to be digested. This in turn provides more benefits in terms of tipping and energy utilization. The thermophilic 10-day has the lowest NPV and this is attributed mainly to the fact that it can accept the highest quantity of HSW compared to the other alternatives.

Overall, the NPV results of the selected top five alternatives are comparable given the level of analysis; therefore, it was essential to evaluate them based on non-cost criteria as well for EWA to make a decision moving forward.

# 5.3 Implementation Schedule

The following discusses certain factors that played a key role in determining a phasing timeline for the alternatives and the implementation schedule for the top five alternatives from Round 2 of SWEET.

#### 5.3.1 Digester Excess Capacity Evaluation

The following sections describe excess digester capacity scenarios with existing DAFs and RDTs, respectively. These charts were developed assuming high strength waste at 12 percent solids content would be imported into the mesophilic digesters for co-digestion. The digester capacity available in excess of that required to handle sludge was plotted over time at various service conditions.

#### 5.3.1.1 Digester Excess Capacity (DAF)

Figure 5-2 represents when EWA would run out of digester capacity (mesophilic digestion) under different service conditions while DAFs are in operation. It is evident that at maximum month condition with the largest digester out of service, EWA would run out of digester capacity to import any HSW by 2020. At the annual average condition with the largest digester out of service, digester capacity would be completely utilized by 2031. Only the peak 2-week service condition would allow for importation of HSW over the entire planning period; however, the volume of HSW imported would reduce over time.

Figure 5-2. Excess digester capacity available for importing 12 percent HSW with DAF

#### 5.3.1.2 Digester Excess Capacity (RDT)

The following Figure 5-3 represents when EWA would run out of digester capacity (mesophilic digestion) under different service conditions if RDTs are installed for co-thickening of PS and WAS. At maximum month condition with the largest digester out of service, EWA would run out of digester capacity to import any HSW by 2026. At the annual average condition with the largest digester out of service, digester capacity would be completely utilized by 2038. Only the peak 2-week service condition would comfortably allow for importation of HSW over the entire planning period.

Figure 5-3. Excess digester capacity available for importing 12 percent HSW with RDTs

Based on this evaluation, to successfully implement a food waste program, it is imperative to install RDTs for thickening as it buys EWA more digester capacity without having to build a new digester. It also provides EWA with enough time in the future to make any enhancements to its existing digesters in terms of installing Omnivore or switching to a thermophilic digestion process.

#### 5.3.2 Implementation Schedules for Top Five Alternatives

The previous sections on digester capacity tie in to the development of the implementation schedule for each alternative as they provide information on when the digester projects are required over the planning period whilst maintaining a reliable food-waste program.

The following sections outline a phasing schedule for different project elements listed under each of the selected top five alternatives. The width of each bar in the graphics indicate the project duration and they commonly range from 2 to 3 years. The projects identified in this BEE Plan are divided into two main categories (represented above and below x-axis in the following figures):

- **Core Mission Related Activities.** These projects are imperative to maintaining capacity and redundancy in the overall solids treatment process for EWA over the course of the planning period.
- Waste Resource Recovery Related Activities. These projects provide opportunistic pathways for EWA to enhance their energy recovery and utilization.

#### 5.3.2.1 Alternative 1 Implementation Schedule

Alternative 1 includes installation of RDTs for thickening, mesophilic digestion with Omnivore technology, centrifuge dewatering, operation of one dryer, and pipeline injection. Figure 5-4 below represents various projects related to core mission and waste resource recovery for EWA over the 20-year timeline.

Figure 5-4. Implementation schedule for Alternative 1

Core Mission Projects: Digester improvements for Digesters 4, 5, and 6, and installation of RDTs, must be implemented as early as possible (2018). Upon installation of RDTs (2021), the digester capacity will be adequate to handle sludge loads until 2038. Construction of a new truck loadout with odor control for effective hauling of Class B biosolids should be completed by 2022. Modifications to the existing dryer shall be completed by 2026 due to the limited useful life on the mechanical parts on the unit. The existing centrifuges would be upgraded at the same time. Future projects, such as truck traffic improvements, shall be completed later in the timeline as it is not critical to the effective operation of the overall solids process.

Waste Resource Recovery Projects: Implementation of pipeline injection along with HSW receiving upgrades as early as 2018 will allow EWA to derive maximum benefits from RINS and LCFS as well as accept larger quantities of HSW, Conversion of one of the small digesters into an Omnivore tank shall be completed by 2024 which will provide adequate digester capacity to handle sludge loads beyond 2040. Future conversion of a second small digester to an Omnivore tank may happen later in the timeline (2035); however, it is not critical to the effective operation of the overall solids process.

#### 5.3.2.2 Alternative 2 Implementation Schedule

Alternative 2 includes installation of RDTs for thickening, mesophilic digestion with Omnivore technology, centrifuge dewatering, operation of two dryers, and pipeline injection. Figure 5-5 below represents various projects related to core mission and waste resource recovery for EWA over the 20-year timeline.

#### **EXPOSURE TO ODOR AND HAULING CAPACITY FOR** RISKS FOR CLASS B BIOSOLIDS **CLASS A BIOSOLIDS** DIG 4, 5 & 6 IMPROVEMENTS THICKENING IMPROVEMENTS (RDTs) NEW DRYER -MODIFICATIONS CENTRIFUGE **UPGRADES** 2025 2026 2030 2035 2018 2020 2040 PIPELINE INJECTION : HSW RECEIVING **UPGRADES DIGESTER PROJ (1st** OMNIVORE) DIGESTER PROJ (2nd Core Mission Related Activities - Waste Resource Recovery Related Activities

#### **ALTERNATIVE 2: RDT-MESOPHILIC-CENTRIFUGE-2 DRYER**

Figure 5-5. Implementation schedule for Alternative 2

Core Mission Projects: Digester improvements for Digesters 4, 5, and 6, and RDTs, must be implemented as early as possible (2018). On installation of RDTs (2021), the digester capacity will be adequate to handle sludge loads until 2038. Until the installation of a second dryer, improvements to the existing truck load out need to be made to facilitate Class B biosolids hauling. Installation of a new second dryer, modifications to the existing dryer and centrifuge upgrades shall be completed by 2026. This implies that beyond 2026, Class A pellets will be the only end-product produced by EWA.

Waste Resource Recovery Projects: Implementation of pipeline injection, along with HSW receiving upgrades, as early as 2018 will allow EWA to derive maximum benefits from RINS and LCFS as well as accept larger quantities of HSW, Conversion of one of the small digesters into an Omnivore tank shall be completed by 2028, which will provide adequate digester capacity to handle sludge loads beyond 2040. Future conversion of a second small digester to an Omnivore tank may happen later in the timeline (2034); however, it is not critical to the effective operation of the overall solids process.

#### 5.3.2.3 Alternative 3 Implementation Schedule

Alternative 3 includes installation of RDTs for thickening, thermophilic 15-day digestion with Omnivore technology, centrifuge dewatering, operation of one dryer and pipeline injection. Figure 5-6 below represents various projects related to core mission and waste resource recovery for EWA over the 20-year timeline.

Figure 5-6. Implementation schedule for Alternative 3

Core Mission Projects: Digester improvements for Digesters 4, 5, and 6, and RDTs, must be implemented as early as possible (2018). On installation of RDTs (2021), the digester capacity will be adequate to handle sludge loads until 2038. Construction of a new truck loadout with odor control for effective hauling of Class B biosolids shall be completed by 2022. Modifications to existing dryer shall be completed by 2026 due to the limited useful life on the mechanical parts on the unit. The existing centrifuges shall be upgraded at the same time. In this alternative, the existing mesophilic digesters shall be converted into thermophilic digesters by 2028. Future projects, such as truck traffic improvements, shall be completed later in the timeline as they are not critical to the effective operation of the overall solids process.

Waste Resource Recovery Projects: Implementation of pipeline injection, along with HSW receiving upgrades, as early as 2018 will allow EWA to derive maximum benefits from RINS and LCFS as well as accept larger quantities of HSW, Thermophilic digestion provides more organic loading capacity than traditional mesophilic digestion and therefore pushes out conversion of one of the small digesters into an Omnivore tank by 2035, which will provide adequate digester capacity to handle sludge loads beyond 2040. Future conversion of a second small digester to an Omnivore tank may happen later in the timeline (2035); however, it is not critical to the effective operation of the overall solids process.

#### 5.3.2.4 Alternative 4 Implementation Schedule

Alternative 4 includes installation of RDTs for thickening, thermophilic 15-day digestion with Omnivore technology, centrifuge dewatering, operation of two dryers and engines only with no pipeline injection. Figure 5-7 below represents various projects related to core mission and waste resource recovery for EWA over the 20-year timeline.

#### **EXPOSURE TO ODOR AND HAULING** CAPACITY FOR **RISKS FOR CLASS B BIOSOLIDS CLASS A BIOSOLIDS IMPROVEMENTS** THICKENING IMPROVEMENTS (RDTs) NEW DRYER + MODIFICATIONS CENTRIFUGE UPGRADES THERMOPHILIC **UPGRADES** ENGINE/ CATALYST UPGRADES 2020 2025 2026 2030 2035 2040 2018 **HSW RECEIVING** UPGRADES **DIGESTER PROJ (1st** OMNIVORE) DIGESTER PROJ (2nd OMNIVORE) Core Mission Related Activities Waste Resource Recovery Related Activities

#### ALTERNATIVE 4: RDT-THERMOPHILIC 15-DAY-CENTRIFUGE-2 DRYER (ENGINES ONLY)

Figure 5-7. Implementation schedule for Alternative 4

Core Mission Projects: Digester improvements for Digesters 4, 5, and 6, and RDTs, must be implemented as early as possible (2018). On installation of RDTs (2021), the digester capacity will be adequate to handle sludge loads until 2038. Until the installation of a second dryer, improvements to the existing truck load out need to be made to facilitate Class B biosolids hauling. Installation of a new second dryer, modifications to the existing dryer, and centrifuge upgrades shall be completed by 2026. This implies that beyond 2026, Class A pellets will be the only product produced by EWA. The existing engines catalyst shall be upgraded by 2026 which will bring about additional engine capacity to beneficially use the increased production of digester gas.

Waste Resource Recovery Projects: Implementation of HSW receiving upgrades as early as 2018 will allow EWA to accept larger quantities of HSW, Thermophilic digestion provides more organic loading capacity than traditional mesophilic digestion and therefore pushes out conversion of one of the small digesters into an Omnivore tank by 2034, which will provide adequate digester capacity to handle sludge loads beyond 2040. Future conversion of a second small digester to an omnivore tank may happen later in the timeline (2034); however, it is not critical to the effective operation of the overall solids process.

#### 5.3.2.5 Alternative 5 Implementation Schedule

Alternative 5 includes installation of RDTs for thickening, thermophilic 10-day digestion with Omnivore technology, centrifuge dewatering, operation of two dryers and pipeline injection. Figure 5-8 below represents various projects related to core mission and waste resource recovery for EWA over the 20-year timeline.

#### EXPOSURE TO ODOR AND HALLING CAPACITY FOR CLASS A RISKS FOR CLASS B BIOSOLIDS BIOSOLIDS DIG 4. 5 & 6 IMPROVEMENTS THICKENING IMPROVEMENTS (RDTs) NEW DRYER 4 MODIFICATIONS CENTRIFUGE UPGRADES THERMOPHILIC 10-DAY UPGRADES 2020 2025 2026 2030 2035 2040 2018 PIPELINE INJECTION-**NEW HSW RECEIVING** FACILITY Core Mission Related Activities Waste Resource Recovery Related Activities

#### **ALTERNATIVE 5: RDT-THERMOPHILIC 10-DAY-CENTRIFUGE-2 DRYER**

Figure 5-8. Implementation schedule for Alternative 5

Core Mission Projects: Digester improvements for Digesters 4, 5, and 6, and RDTs, must be implemented as early as possible (2018). Upon installation of RDTs (2021), the digester capacity will be adequate to handle sludge loads until 2038. Until the installation of a second dryer, improvements to the existing truck load out need to be made to facilitate Class B biosolids hauling. Installation of a new second dryer, modifications to the existing dryer, and centrifuge upgrades shall be completed by 2026. This implies that beyond 2026, Class A pellets will be the only end-product produced by EWA. In this alternative, the existing mesophilic digesters shall be converted into thermophilic digesters by 2028. On switching to a thermophilic 10-day digestion process, the digester capacity shall be sufficient to handle sludge loads beyond 2040.

Waste Resource Recovery Projects: Implementation of pipeline injection as early as 2018 will allow EWA to derive maximum benefits from RINS and LCFS. Thermophilic digestion with a 10-day retention time allows EWA to accept increased quantities of HSW; therefore, construction of a new HSW receiving facility is required for effective operation. This shall be completed along with the pipeline injection project.

# **Section 6: Non-Economic Evaluation of Top Five Alternatives**

The economic evaluation of the top 5 alternatives indicated that the NPV results of these alternatives were similar and within the anticipated margin of accuracy for this level of analysis. Therefore, a consideration of non-cost criteria and risks is warranted in selection of a preferred alternative for implementation.

The following criteria were used to determine the feasibility of the alternatives from a non-economic standpoint:

- Solids process facilitates access to multiple end-use markets
- Provides consistency with energy sustainability goals
- Provides consistency with overall goals and objectives of EWA
- Addresses neighborhood impacts (encompasses truck traffic, odors, and dust)
- Provides a strategic investment to manage risks
- Addresses impacts to liquids stream process/future nutrient removal and/or recycled water
- Serves as a resource recovery facility (food waste acceptance) in a manner that benefits member agencies' communities
- Maximizes user rate stability in the long term

#### 6.1.1 Mesophilic versus Thermophilic Comparison on Non-Cost Criteria

The following provides information on comparing mesophilic digestion and thermophilic digestion processes from a non-economic standpoint:

- Mesophilic digestion is the current process at EWA.
- Mesophilic digestion process is well known and understood by EWPCF staff.
- Mesophilic digestion and Thermophilic digestion processes are widely used in the industry.
- Mesophilic digestion provides enough digester gas to meet energy recovery goals.
- Conversion to a thermophilic process is easy and can be implemented at any time.
- Implementation of enhanced co-digestion could pay for future upgrades.
- Deferring implementation of the thermophilic process allows time to investigate impacts of thermophilic sludge on the dryer, which was identified as a risk, as no installations of drum dryers coupled with thermophilic digestion could be identified.

The following Table 6-1 ranks the three digestion processes on the non-cost criteria.

Table 6-1. Digestion Process Non-Cost Ranking Matrix					
Non-Cost Criteria	Mesophilic	Thermophilic 15-day	Thermophilic 10-day		
Meets goals and objectives of EWA	+	+	+		
Multiple end-use markets	+	+	+		
Energy sustainability	+	+	+		
Neighborhood impacts	+	+	+		
Risk management	+	0	0		
Impact to liquids stream processes	+	+	+		
Resource recovery	+	+	+		
Long-term user rate stability	+	+	+		

From the ranking and analysis of the three digestion processes, it is recommended to continue mesophilic digestion at EWA until capacity or energy recovery goals change.

#### 6.1.2 One-Dryer versus Two-Dryer Comparison on Non-Cost Criteria

The following provides information on comparing one dryer and two dryers from a non-economic standpoint:

- Operation of the dryer greatly reduces truck traffic
- A dryer provides end-use resilience through Class A
- Regional options for dried product can diversify management of end-product
- A dryer reduces offsite odors related to truck traffic and loadout

Table 6-2 below ranks one dryer versus two dryers on non-cost criteria.

Table 6-2. Dryer Non-Cost Ranking Matrix					
Non-Cost Criteria	One Dryer	Two Dryers			
Meets goals and objectives of EWA	-	+			
Multiple end-use markets	0	+			
Energy sustainability	+	0			
Neighborhood impacts		+			
Risk management	0	+			
Impact to liquids stream processes	0	0			
Resource recovery	+	0			
Long-term user rate stability	0	0			

From the ranking and analysis of dryer options, it is recommended to plan for the implementation of a second dryer in the future.

#### 6.1.3 Engines versus Engines/Pipeline

The following provides information on comparing running engines only versus running engines and injecting gas into the pipeline from a non-cost standpoint:

- Engines are currently used at EWPCF and are a generally accepted form of energy recovery.
- Pipeline injection includes more risk but greater potential to deliver rewards, both economic and environmental.
- Pipeline will pay for gas system upgrades and has potential for large economic benefit. In general, DG is most valuable as CNG (shown on Figure 6-1).
- Pipeline injection allows use of natural gas in the engines and dryer.

Figure 6-1. Relative value of DG energy based on alternative

The following Table 6-3 ranks one engine versus engines/pipeline on non-cost criteria.

Table 6-3. Engine Utilization Non-Cost Ranking Matrix					
Non-Cost Criteria	Engines	Engines + Pipeline			
Meets goals and objectives of EWA	+	+			
Multiple end-use markets	0	+			
Energy sustainability	0	+			
Neighborhood impacts	0	0			
Risk management	+	-			
Impact to liquids stream processes	0	0			
Resource recovery	0	+			
Long-term user rate stability	0	+			

From the ranking and analysis of engine utilization options, it is recommended to consider implementation of gas scrubbing to pipeline to capitalize on market opportunity.

#### 6.1.4 Non-Cost Ranking Recommendations

The following are the recommendations BC is providing based on the non-cost criteria evaluation:

- Continue operation of mesophilic digestion until capacity or energy recovery goals change.
- Plan for implementation of a second dryer in the future.
- Consider implementation of gas scrubbing to pipeline to capitalize on market opportunities.

# **Section 7: Final Phasing Considerations for the Recommended Alternative (Alternative 2)**

Based on ongoing discussion with EWA and interactive project workshops on evaluating EWA's next steps at modifying its existing solids process, key project elements were identified and categorized based on near-, short-, and long-term projects for the recommended alternative. Figure 7-1 represents the implementation schedule of the recommended alternative.

#### **ALTERNATIVE 2: RDT-MESOPHILIC-CENTRIFUGE-2 DRYER EXPOSURE TO ODOR AND HAULING CAPACITY FOR** RISKS FOR CLASS B BIOSOLIDS **CLASS A BIOSOLIDS** DIG 4, 5 & 0 IMPROVEMENTS THICKENING **IMPROVEMENTS** (RDTs) NEW DRYER -MODIFICATIONS CENTRIFUGE **UPGRADES** 2018 2020 2025 2026 2030 2035 2040 PIPELINE INJECTION : HSW RECEIVING **UPGRADES** DIGESTER PROJ (1st OMNIVORE) DIGESTER PROJ (2nd Core Mission Related Activities - Waste Resource Recovery Related Activities

Figure 7-1. Implementation schedule for Alternative 2

For purposes of framing implementation of the capital improvements associated with the recommended alternatives, the BC team divided the projects into near-term (defined as 0 to 5 years), short-term (5 to 10 years) and long-term (10 to 20 years). The near-term projects include those that were generally common among the top five alternatives and address immediate constraints and opportunities associated with the solids and energy processes at EWPCF. These are as follows:

- **Digester Improvements:** This includes mixing upgrades and structural modifications to existing Digesters 4, 5, and 6.
- High Strength Waste Receiving Upgrades: This includes mechanical upgrades to existing equipment.
- Thickening Improvements (RDTs): This includes installing RDTs for co-thickening of PS and WAS.
- **Pipeline Injection:** This includes sending a portion of the digester gas to the pipeline. This would apply to all alternatives except thermophilic 15-day with two dryers.

The short-term projects address a mixture of aging equipment (such as the dryer and centrifuges) as well as some desirable improvements to support high-strength waste receiving and biosolids beneficial use. The major short-term projects are:

- Truck Loadout Improvements: This includes improving the existing truck loadout area and addressing
  any odor related issues. This project can be customized to the degree of improvement of the loadout
  found necessary at the time.
- **Dryer Modifications:** This includes modifications to the existing dryer building, replacement of the dryer drum, and other associated mechanical upgrades.
- Omnivore Project I: This includes repurposing one of the small digesters (1 or 2) to serve as an Omnivore tank.
- **Centrifuge Upgrades:** This includes replacement of existing centrifuges with larger and more efficient units.

The long-term projects allow for full implementation of the recommended alternative. Most of these projects address the increase in loads to the EWPCF and include:

- Second Dryer: This includes installing a second dryer.
- Omnivore Project II: This includes repurposing the second small digester to serve as another Omnivore tank in the event of requiring more digester capacity.
- **Truck Traffic Improvements:** This includes modifications to the road within EWA to facilitate easy thoroughfare of trucks in and out of the facility.

# **Section 8: Summary**

A plethora of solids and energy alternatives were evaluated using the SWEET life-cycle analysis tool. This tool allowed for evaluating alternatives based on different process parameters as well as costs. From an economic evaluation standpoint, the SWEET tool was used through multiple rounds to arrive at top five alternatives that performed best on an NPV basis. Regular progress calls and interactive workshops with EWA facilitated the decision making to arrive at the top five alternatives. Implementation schedules were created for each of the top five alternatives. On observing almost comparable NPVs for each of the top five alternatives. a non-economic evaluation was performed on the alternatives and ranked against specific key non-cost criteria. BC's recommendations from the evaluation are mentioned in the following sub-sections.

# 8.1 Solids Next Steps and Recommendations

BC recommends the following next steps related to solids and energy utilization:

- Implement common project elements such as RDTs, digester improvements, food waste receiving, and truck loadout.
- Continue operation of mesophilic digestion until capacity or energy recovery needs change.
- Plan for implementation of a second dryer.

# 8.2 Energy Next Steps and Recommendations

BC recommends the following next steps related to the energy alternatives:

- Pursue pipeline injection with SDG&E and initiate capacity analysis to determine pipeline location and feasibility of accepting biomethane. If pipeline injection is feasible, pursue a private-public partnership arrangement to deliver a gas upgrading project without requiring a capital outlay from EWA.
- Pursue a new air permit with CO catalyst to unlock additional engine capacity and initiate discussions with SDG&E for NEM electrical rate schedule to potentially lower power bills and export power.
- Consider construction of gas scrubbing to pipeline to capitalize on market opportunities and offset costs for needed gas conditioning equipment.

Based on the results of the SWEET model effort, multiple energy alternatives can meet the goals of the BEE project; therefore, there is no single recommended alternative. The best steps forward are to initiate conversations with SDG&E and San Diego Air Pollution Control District, and pursue a private-public partnership in parallel to learn more about costs and challenges to implementing the alternatives that show economic benefit and meet the BEE project goals. If the barriers to achieving an alternative are too difficult to overcome (for example, an air permit revision cannot be obtained), EWA can eliminate that as a feasible option.

# **Executive Summary**

The Encina Water Pollution Control Facility (EWPCF) currently has four 750-kilowatt (nameplate) internal combustion engines to utilize some of the digester gas (DG) and sends remaining DG to the biosolids dryer or flare. Brown and Caldwell is evaluating alternative technologies to utilize any DG beyond what is used in the engines. For one of the potential projects identified in Technical Memorandum (TM) 7, where digester gas is converted to renewable natural gas (RNG) and injected to the pipeline, grants and incentives are available. For projects where the output of the existing cogeneration facility is increased—reaching the point of net metering—no funding is likely to be available. The grants and incentive programs discussed in this TM include:

- Renewable Fuel Standard (RFS)
- Low Carbon Fuel Standard (LCFS)
- Pipeline Interconnection Incentive Program
- SoCalGas Biogas Conditioning/Upgrading Services Tariff
- California Energy Commission (CEC)
- CalRecycle
- Self-Generation Incentive Program (SGIP)

Additionally, state and local greenhouse gas (GHG) reduction goals are summarized in this TM.

### **Section 1: Introduction**

Encina Wastewater Authority (EWA) has undertaken a Biosolids Energy and Emissions (BEE) Plan which will be used to update the previous Energy and Emissions Strategic Plan and integrate pertinent recommendations arising from the recently completed Process Master Plan. The BEE Plan has several goals:

- 1. Provide a comprehensive analysis of all project elements including biosolids treatment, gas use, energy generation, and waste heat;
- 2. Address capacity limitations in the solids handling process at the EWPCF;
- 3. Assess which alternative is likely to be the most cost effective and sustainable solution for EWA;
- 4. Move the EWPCF toward greater energy independence; and
- 5. Reduce greenhouse gas (GHG) emissions.

# 1.1 Purpose and Scope

This TM is preceded by TMs 1 to 7 which address the following subjects:

- TM 1 Baseline Energy Profiles and Projections
- TM 2 Technology Evaluations for Biosolids Handling
- TM 3 Technology Evaluations for Alternative Power Production
- TM 4 Technology Evaluations for Biogas Production
- TM 5 Technology Evaluations for Waste Heat
- TM 6 Air Emissions
- TM 7 Alternatives Development, Evaluation, and Selection

The purpose of TM 8 is to provide an overview of the available funding and incentive opportunities to offset capital cost associated with the potential alternatives. This TM also includes a discussion of the GHG impacts of the preferred alternative identified in TM 7 to describe how the BEE project supports state and local goals.

# 1.2 Potential Projects

There are several viable projects identified in TM 7 which could offer economic benefit and a reduction in GHG emissions. These projects can be implemented as standalone or in parallel and include the following:

- Engines (current operation)
- Engines with oxidation catalyst for carbon monoxide (CO2) reduction
- Gas conditioning to remove hydrogen sulfide, moisture, and siloxanes
- Digester gas upgrading to produce RNG for pipeline injection

## Section 2: Overviews of Grants and Incentives

An overview of the various grants and incentives for RNG production projects is provided in this section. The overview includes background information, program descriptions, eligibility requirements, and available funding. Additionally, discussions of how each program applies to the RNG production project at EWPCF are included in this section.

#### 2.1 Renewable Fuel Standard

The RFS is a federal program administered by the Environmental Protection Agency (EPA) that incentivizes reducing GHG emissions from petroleum-based transportation fuels and expanding the renewable fuels sector. The program operates in a cap-and-trade manner by requiring a certain quantity of petroleum-based transportation fuels to be replaced by renewable fuels every year. The quantity of non-renewable fuels that must be replaced is set to increase annually through 2022. Petroleum refiners and petroleum fuel importers, known as the obligated parties, are required to demonstrate compliance with the RFS. These organizations can demonstrate compliance by obtaining RFS credits, which are called Renewable Identification Numbers (RINs).

RINs are generated when a gallon of renewable fuel is produced. The obligated parties must obtain a certain amount of RINs each year to offset the quantity of petroleum-based transportation fuel that was sold. RINs can be obtained by physically blending renewable fuels that have attached RINs, purchasing gallons of renewable fuel that have attached RINs, or directly purchasing RINs from the market. Market trading of RINs creates an economic opportunity for organizations that produce renewable transportation fuels because renewable fuel producers can generate additional revenue through the sale of RINs to obligated parties. Renewable fuel producers can sell RINs directly to obligated parties; however, these producers typically hire a RINs broker to assist with credit acquisitions, transactions, and quality assurance.

Four categories of renewable fuels are covered under the RFS program and include biomass-based diesel, cellulosic biofuel, advanced biofuel, and conventional renewable fuel. Each of these categories has a different GHG reduction threshold that the renewable fuel must meet to be eligible for RINs. The categories also have different assigned economic values and are identified by their respective "D codes" (D3 through D7). Typically, RNG produced at a wastewater treatment plant is categorized as D3 (cellulosic) RINs. However, there is an ongoing debate on whether digester gas derived from co-digestion of high strength waste (i.e., food waste, source separated organics; fats, oils and grease; and brewery waste) should be

considered a D3 or D5 (advanced biofuel) RIN. The EPA currently categorizes co-digestion product RINs as D5, which is valued two to three times less than a D3 RIN.

Any RNG produced at the EWPCF would be eligible for RINs credits. To obtain these credits, EWA would need to demonstrate the RNG is used as vehicle fuel. Even if RNG is injected to the utility pipeline and is not physically transferred to a vehicle fleet, EWA can reach an agreement with a natural gas fuel purchaser and complete a "paper transaction." D3 RINs values have fluctuated from less than \$1 per RIN to over \$2 per RIN; these credits can provide a significant source of income for any renewable natural gas that EWA sends to the utility pipeline.

#### 2.2 Low Carbon Fuel Standard

The LCFS is a program enacted by the State of California (State) to reduce the carbon intensity of transportation fuels used in the state. This program is part of a larger set of California regulations to reduce GHG emissions and cut statewide petroleum use in half by 2030. Like the RFS, the LCFS program operates as a cap-and-trade system. The EWPCF's potential RNG pipeline injection project is eligible for LCFS credits.

In the case of the LCFS program, carbon intensity, which is a measure of the GHG emissions produced throughout the life-cycle of a fuel, is used to compare the various non-renewable and renewable transportation fuels. Carbon intensity is expressed in grams of CO<sup>2</sup> equivalent per megajoule (g CO<sub>2</sub>/MJ) of energy provided by the fuel. A baseline carbon intensity standard was set by the State and this baseline standard will decrease annually until 2020, after which the standard will remain constant until 2030. Entities that produce transportation fuels with higher carbon intensities than the standard operate at a deficit and must obtain LCFS credits from entities that produce transportation fuels with carbon intensities that are lower than the standard.

LCFS credits are generated when a transportation fuel that has a lower carbon intensity than the standard is produced. These credits can be sold to petroleum refiners or other organizations that exceed the carbon intensity compliance limit. To generate and sell LCFS credits, a low carbon fuel producer must register with the California Air Resources Board (CARB) to become a regulated party. Once registered, the renewable fuel producer can track the amount of low carbon intensity fuel that is produced using CARB's LCFS Reporting Tool. LCFS credits are then received, based on the carbon intensity and the quantity of the fuel. The accounting and transaction processes for LCFS credits are similar to the RINs' processes.

CARB has compiled a database of LCFS fuel pathways that lists the life-cycle carbon intensities of various types of fuels. According to the database, the carbon intensity of RNG produced at a wastewater treatment plant is between 7.8 g CO<sub>2</sub>/MJ and 30.9 g CO<sub>2</sub>/MJ, which is significantly lower than gasoline that has a carbon intensity of 96 g CO<sub>2</sub>/MJ. LCFS credits typically fluctuate around \$1 per diesel gallon equivalent (DGE) based on the carbon intensity values for RNG, but decrease annually.

# 2.3 Pipeline Interconnection Incentive Program

The California Public Utilities Commission (CPUC) has adopted an incentive program which provides funds for biomethane projects that interconnect to California utility natural gas pipeline systems. Funds provided by the incentive program may be used for up 50 percent of the eligible interconnection costs and each project can apply for up to \$3 million in funding. Eligible project costs include the compression equipment for product gas, utility point of receipt, and utility pipeline extension as depicted on Figure 2-1.

Figure 2-1. Two primary components of an interconnection eligible for CPUC incentive Source: https://www.socalgas.com/1443741248177/PowerofWaste\_SoCalGas\_Lucas.pdf

Total program funding for all projects is capped at \$40 million, and the program is open to eligible biomethane projects through December 31, 2021. If EWA decides to upgrade digester gas to pipeline quality biomethane, this incentive program may serve as a viable opportunity to reduce interconnection costs.

# 2.4 SoCalGas Biogas Conditioning/Upgrading Services Tariff

The SoCalGas Biogas Conditioning/Upgrading Services (BCUS) Tariff is an optional tariff service that would allow SoGalGas to plan, design, procure, construct, own, operate, and maintain biogas conditioning and upgrading equipment at a customer's facility. This relationship is illustrated on Figure 2-2. This BCUS tariff was originally investigated as a potential partnering option, but since EWA is not a SoCalGas customer, the EWPCF is not eligible.

Figure 2-2. SoCalGas BCUS Tariff process to plan, design, procure, construct, own, operate, and maintain biogas conditioning and upgrade equipment process

Under this tariff, the customer would own, operate, and maintain all equipment and facilities upstream of the BCUS receipt point for the untreated biogas and downstream of the BCUS point of service delivery for the treated gas (RNG). The customer would also be responsible for providing electric and natural gas services to run the equipment. This optional tariff will remain open until 2025 for new customers. Actual costs associated with this tariff will require further discussion with SoCalGas and would cover the full cost to provide capital and operation and maintenance services. The program does not bear any risk to SoCalGas ratepayers. A breakdown of assigned responsibilities to the customer and SoCalGas for a theoretical tariff arrangement is shown in Table 2-1.

Table 2-1. SoCalGas BCUS Tariff Responsibilities							
Responsible Parties	Upfront investment for upgrading facility	On-going mainte- nance of upgrading facility	Parasitic load (utility costs to run the facility)	Owns the biogas and RNG	Determines the contract term	Interconnection with the utility	
SoCalGas	X	х			Negotiable		
EWA			Х	Х	(typically 10 to 20 years)	Х	

# 2.5 California Energy Commission Grant Opportunities

The CEC has historically offered grants for projects that develop alternative and renewable fuels through the Alternative and Renewable Fuel and Vehicle Technology Program (ARFVTP). The ARFVTP provides funding to promote changes to transportation fuels and vehicles used in California to ultimately help the state meet its

GHG reduction goals. Each year of the past 3 years, the CEC has allocated approximately \$100 million to the ARFVTP and about \$20 million has been reserved for biomethane projects. Two ARFVTP funding opportunities for Biofuel Production and Supply have been proposed for 2018 under the Alternative Fuel Production Investment Plan Category. As of February 9, 2018, grant solicitations for these two opportunities have not been released. Additionally, the ARFVTP has been extended through 2024; future biofuel grants can be expected.

# 2.6 CalRecycle

The California Department of Resources Recycling and Recovery, more commonly known as CalRecycle, oversees State solid waste programs. CalRecycle instituted the Greenhouse Gas Reduction Grant and Loan Programs (Grant and Loan Programs) after the State established the Greenhouse Gas Reduction Fund in 2012. The Grant and Loan Programs incentivize capital projects that reduce GHG emissions by diverting more material from landfills and using the diverted material to produce beneficial products (e.g., RNG). CalRecycle funding opportunities have been released annually; however, State allocations for CalRecycle GHG reduction programs have fluctuated between \$25 and \$60 million.

The Organics Grant Program is one of the Grant and Loan Programs' overseen by CalRecycle. This program provides funding for digestion and compost projects that divert organic materials from landfills. Although the EWPCF does not have an on-site food waste diversion or pre-processing program, the Organics Grant Program may be applicable if a food waste digestion partnership with Waste Management or another solid waste hauler is pursued.

# 2.7 Self-Generation Incentive Program

The SGIP provides funding for the installation of technologies that generate or store electrical energy to meet a portion of or all a facility's electrical requirements. The program is overseen by the CPUC and is administered by the State utilities companies. Incentives are provided based on the generating capacity of the equipment. To be eligible for SGIP funding, electricity-generating equipment must be commercially available, interconnected to the local utility's distribution system, and permanently installed on site. Any equipment that has been interconnected for more than 12 months before submission of an application is not eligible for SGIP incentives. Therefore, if cogeneration were expanded at the EWPCF through the installation of gas conditioning and oxidation catalysts and by pursuing a new permit, this project would not be eligible for SGIP funding because new generating equipment is not being installed.

# **Section 3: State and Local Greenhouse Gas Reduction Goals**

The grants and incentives described in Section 2 all serve to incentivize projects that reduce GHG emissions in California. The overarching State and local GHG reduction goals and the impact of RNG production on these GHG goals are discussed in this section.

#### 3.1 Local Greenhouse Gas Reduction Goals

The County of San Diego (County) has completed a Draft Final Climate Action Plan that identifies the County's GHG reduction targets and strategies to meet these targets. GHG reduction goals for the County include:

- Two (2) percent below 2014 levels by 2020
- Forty (40) percent below 2014 levels by 2030
- Seventy-seven (77) percent below 2014 levels by 2050

Currently, the most significant GHG emissions in the County are from on-road transportation, which comprised approximately 45 percent of the total GHG emissions in 2014. The County has identified multiple strategies to reduce GHG emissions from on-road transportation in the Climate Action Plan. One of these strategies is the use of alternative fuels in County projects, and RNG is listed as one of the viable renewable fuels. Additionally, the County also intends to reduce fleet emissions, and expansion of alternative fuels use has been identified as an option to achieve this goal.

#### 3.2 State Greenhouse Gas Reduction Goals

In 2006, the State passed Assembly Bill 32, which set initial GHG emissions reduction goals to achieve 1990 GHG levels by 2020. The State expanded on this initiative through Senate Bill 32, which mandates further reductions of GHG emissions to 40 percent below 1990 levels by 2030. Ultimately, the State hopes to reduce GHG emissions to 80 percent below 1990 levels by 2050.

Every 5 years, since the passage of Assembly Bill 32, the State has developed a Climate Change Scoping Plan. In the 2017 plan, the State identified the transportation sector as the largest emitter of GHGs, making up about 39 percent of statewide emissions. As a key strategy to reduce emissions from the transportation sector, the State aims to promote, research, develop, and deploy low carbon fuels such as RNG. The State has already worked to realize this strategy through the LCFS and ARFVTP programs discussed in Section 2. Additionally, the State aims to integrate the strategies to reduce emissions from the transportation sector with other State initiatives. This integration plan has been advanced through the Short-Lived Climate Pollutants Plan, which requires reductions in methane emissions from landfills, wastewater treatment facilities, and dairies, and incentives for using diverted methane for vehicle fuel and alternative power.

# 3.3 Impact of Renewable Natural Gas Production on Greenhouse Gas Emissions

The GHG impact of upgrading digester gas to RNG was discussed in TM 6. Within the scope boundary of the EWPCF, upgrading digester gas to RNG for pipeline injection will increase anthropogenic GHG emissions because sending all digester gas to the pipeline will result in increasing natural gas-fired combustion in the engines or purchasing electricity directly from San Diego Gas and Electric. Carbon dioxide in the tail gas from the biogas separation process may also add to GHG emissions.

However, within the scope of local and State GHG reduction goals, upgrading to RNG may have an overall net GHG reduction. RNG produced at the EWPCF may ultimately be used as vehicle fuel, which would supplant a high carbon intensity, petroleum-based fuel (e.g., diesel). Petroleum-based diesel has a much higher carbon intensity than California pipeline natural gas. Thus, the benefits of using RNG to replace diesel for vehicle fuel would outweigh the costs of switching from digester gas to pipeline natural gas in the engines at the EWPCF. Additionally, increasing the availability of RNG for vehicle fuel use aligns with local and State GHG reduction goals of expanding low carbon fuel use.
